

## Synthesis and Characterization of Mononuclear and Binuclear Complexes of Ni(II) and Cu(II) derived from Aromatic Hydrazones

R.S. MANDAL and LALITA MISHRA\*

Department of Chemistry, MLSM College (L.N. Mithila University)  
Darbhanga-846 004, India

In the present work, the synthesis and characterization of mononuclear and binuclear complexes of Ni(II) and Cu(II) derived from aromatic hydrazones is described.

**Key Words:** Mononuclear and binuclear complexes, Ni(II), Cu(II), Hydrazones.

### INTRODUCTION

Several authors reported the hydrazones of aldehydes and ketones<sup>1-4</sup> for the formation of Schiff's bases and their metal complexes. In continuation of the work of Jha *et al.*<sup>5</sup> we have prepared some new hydrazones, viz., *o*-hydroxy-5-methyl salicylidene hydrazone (OHMSAHYH), *o*-hydroxy-5-methyl acetophenone hydrazone (OHMAPHYH), 2-Hydroxy-4-methoxy acetophenone hydrazone (OHMEAPHYH), *o*-hydroxy-5-methyl acetophenone phenyl hydrazone (OHMAPHYPH), *o*-hydroxy-4-methoxy salicylidene phenyl hydrazone (OHMESAHYPH) and *o*-hydroxy-5-methyl salicylidene phenyl hydrazone (OHMSAHYPH) and the mononuclear as well as binuclear complexes of Ni(II) and Cu(II) have been synthesized and characterized on the basis of elemental analysis, conductance, magnetic moments and spectral data.

### EXPERIMENTAL

**Preparation of ML<sub>2</sub> compounds:** The corresponding aqueous metal salt solutions (0.01 M) were treated with methanoic solutions of ligands (0.02 M) and digested on water bath for about half an hour. The solid, coloured compounds were filtered, washed with methanol and dried over fused calcium chloride.

**Preparation of ML<sub>2</sub>B<sub>2</sub> compounds:** The above prepared ML<sub>2</sub> solid compounds were taken in fusion tubes and treated with 3–4 drops of  $\alpha, \beta, \gamma$ -picoline. The fusion tubes were heated on a water bath for about 5 min and left for 3–4 d. The solid compounds were washed with methanol, filtered and dried over vacuum desiccators.

**Preparation of M<sub>2</sub>L<sub>2</sub>X<sub>2</sub> or M<sub>2</sub>L<sub>2</sub>(NO<sub>3</sub>)<sub>2</sub> type complexes:** The ML<sub>2</sub> type complexes were dissolved in hot ethanol and treated with aqueous hydrated MX<sub>2</sub> or M(NO<sub>3</sub>)<sub>2</sub> type compound in the ratio (1 : 1). Both solutions were taken in a conical flask attached with Liebig condenser. The solutions were refluxed for about 6 h. The solid compounds were cooled, filtered, washed with ethanol and water and dried in vacuum desiccators.

**Preparation of  $M_2L_2X_2B_4$  type complexes:** The above prepared  $M_2L_2X_2$  complexes were taken in fusion tubes and treated with 3–4 drops of  $\alpha, \beta, \gamma$ -picoline and heated on a water bath for 5 min and left for 3–4 d. The solid compounds were washed with a small portion of methanol, filtered and dried over vacuum desiccators.

The metal complexes were decomposed with fuming nitric acid and metal content was determined with the method reported in literature<sup>6, 7</sup>. C, H and N were determined at CDRI, Lucknow.

The magnetic moments of solids complexes were determined at room temperature on a Gouy balance using solid copper(II) sulphate pentahydrate as a calibrant. The conductivities of all the complexes were determined by using Systronics conductivity meter bridge in  $10^{-3}$  M in DMF solution. IR spectra, electronic spectra and UV reflectance spectra were recorded at CDRI, Lucknow.

### RESULTS AND DISCUSSION

On the basis of analytical data (Table-1) it has been noted that Ni(II) and Cu(II) form mononuclear complexes of the formulae  $NiL_2$ ,  $CuL_2$ ,  $NiL_2B_2$  and  $CuL_2B_2$  and binuclear complexes of the formulae  $NiL_2X_2$ ,  $Cu_2L_2X_2$ ,  $Ni_2L_2(NO_3)_2$ ,  $Cu_2L_2(NO_3)_2$ ,  $Cu_2L_2X_2B_4$  type, where L denotes:

- (1) *o*-hydroxy 5-methyl salicylidene hydrazone (OHMSAHYH)
  - (2) *o*-hydroxy 5-methyl acetophenone hydrazone (OHMAPHYH)
  - (3) 2-Hydroxy 4-methoxy acetophenone hydrazone (OHMEAPHYH)
  - (4) *o*-hydroxy 5-methyl acetophenone phenyl hydrazone (OHMAPHYPH)
  - (5) *o*-hydroxy 4-methoxy salicylidene phenyl hydrazone (OHMESAHYPH)
  - (6) *o*-hydroxy 5-methyl salicylidene phenyl hydrazone (OHMSAHYPH)
- X = Cl and B =  $\alpha, \beta, \gamma$ -picoline.

TABLE-1  
ANALYTICAL DATA OF Ni(II) AND Cu(II) COMPLEXES OF HYDRAZONES

Thus, diamagnetic  $\text{NiL}_2$  is proposed to have square-planar geometry<sup>8</sup>. Complexes of the type  $\text{NiL}_2\text{B}_2$  have been found to be paramagnetic having magnetic moment values between 2.99–3.02 B.M. suggesting six-coordinated octahedral structure for these complexes<sup>9–11</sup>.

The binuclear complexes of the type  $\text{Ni}_2\text{L}_2\text{X}_2$  and  $\text{Ni}_2\text{L}_2(\text{NO}_3)_2$  are diamagnetic in nature accordingly suggested to have square-planar geometry. For the binuclear complexes of the type  $\text{Ni}_2\text{L}_2\text{X}_2\text{B}_4$  and  $\text{Ni}_2\text{L}_2(\text{NO}_3)_2\text{B}_4$   $\mu_{\text{eff}}$  ranges between 2.21 and 2.40 B.M. These are less than the expected range of magnetic moments (3.1–3.3 B.M.) for octahedral Ni(II). The magnetic data can be interpreted in terms of the presence of antiferromagnetic exchange<sup>12–15</sup> through hydrazine-nitrogen bridge.

Magnetic moment values of Cu(II) complexes,  $\text{CuL}_2$ , have been found to be 1.81–1.84 B.M. which is in the range of the square-planar complexes, whereas for  $\text{CuL}_2\text{B}_2$  type the magnetic moments have been found to be 1.89–1.92 B.M. which is in the range of the octahedral geometry<sup>16–19</sup>.

The magnetic moment data found for the binuclear  $\text{CuL}_2\text{X}_2$  and  $\text{Cu}_2\text{L}_2\text{B}_4$  are in the range of 1.2–1.16 B.M. and 1.12–1.39 B.M. which is due to one unpaired electron. The data agree well with a dimetric model<sup>20</sup>.

Diamagnetic complexes  $\text{NiL}_2$  and  $\text{Ni}_2\text{L}_2\text{X}_2$  show the bands around 15550 and 20000  $\text{cm}^{-1}$  indicating square-planar structure for these complexes<sup>21</sup>.

According to observed band position in the reflection spectra of  $\text{NiL}_2\text{B}_2$  and  $\text{Ni}_2\text{L}_2\text{X}_2\text{B}_4$ , a pseudo-octahedral geometry is proposed.

$\text{CuL}_2$  and  $\text{Cu}_2\text{L}_2\text{X}_2$  show a broad band at about 15000–16650  $\text{cm}^{-1}$  which may be assigned due to the combination of transition in square-planar field<sup>22–26</sup>.

In  $\text{CuL}_2\text{B}_2$  and  $\text{CuL}_2\text{X}_2\text{B}_4$  a broad band has been observed at 13750–14300  $\text{cm}^{-1}$  due to the combination of

This is indicative of distorted octahedral geometry for the complexes of the  $\text{Cu}_2\text{L}_2\text{B}_2$  type and  $\text{Cu}_2\text{L}_2\text{X}_2\text{B}_4$  type.

Comparison of the infrared spectral bands of ligands and their complexes gives very useful information about the nature of the bonding as well as binding sites. A broad band observed in free ligand at around 3200  $\text{cm}^{-1}$  due to  $\nu(\text{O-H})$  is absent in its complexes indicating coordination of phenolic oxygen by deprotonation<sup>27</sup>.

A weak band present in free ligand at about 3400  $\text{cm}^{-1}$  due to  $\nu(\text{N-H})$  remains unaffected upon complexation indicating non-involvement of primary amine residue. Bands observed around 1650  $\text{cm}^{-1}$  assigned as  $\nu(\text{C=N})$  (Schiff's residue) in the free ligands get lowered by about 15–25  $\text{cm}^{-1}$  indicating their involvement in coordination<sup>28</sup>.

A band present at 1010  $\text{cm}^{-1}$  in the infrared spectrum of the ligand is assigned to  $\nu(\text{C-O})$  due to methoxy group. The band remains unchanged in all the complexes, suggesting non-participation of methoxy group in coordination.

The coordination through oxygen and nitrogen is further confirmed by the occurrence of new bands at 500 and 450  $\text{cm}^{-1}$  in the spectra of complexes which are assigned to  $\nu(\text{M}-\text{O})$  and  $\nu(\text{M}-\text{N})$  stretching frequencies respectively.
