

## Spectrophotometric Characterization of Some Doped Pr(III) Systems with O, N and S Containing Ligands

H.K. PANDEY\*, GOURAV CHAWLA and SEEMA GAKHAR

*Department of Chemistry, Government Dungar College, Bikaner-334 001, India*

The present paper is concerned with studies on electronic spectral parameters, *viz.*, Judd Ofelt parameters ( $T_2$ ), nephelauxetic ratio ( $\beta$ ), bonding parameter ( $b^{1/2}$ ) and symmetry parameter ( $T_4/T_6$ ). These parameters are evaluated for doped Pr(III) ion with various organic reagents having O, N and S as donor atoms in M-L interaction and the change in symmetry around Pr(III) ion is discussed.

**Key Words:** Electronic spectral parameters, Doped Pr(III) system.

### INTRODUCTION

Lanthanides are known to form complexes less readily due to deeply buried *f*-orbitals, but their bonding tendency with various types of ligands is also found in literature<sup>1, 2</sup>. Synthesis of sulphonanilides of salicylic acid, methyl salicylate and ethyl salicylate was carried out by employing the steps as mentioned in literature<sup>3-7</sup>.

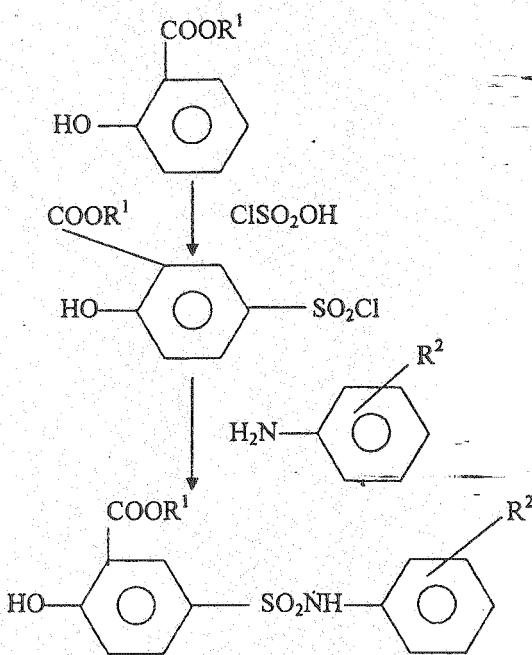

Sulphonanilides have oxygen, nitrogen and sulphur as donor atoms available for interaction with lanthanides; so different sulphonanilides (Table-1) have been taken as ligands for the formation of complexes with Pr(III) ion and their complexation behaviour was established by electronic spectral parameters such as Judd Ofelt intensity parameter ( $T_2$ ,  $T_4$  and  $T_6$ ), nephelauxetic ratio ( $\beta$ ), bonding parameters ( $b^{1/2}$ ) and symmetry parameter ( $T_4/T_6$ ) etc.

### EXPERIMENTAL

Nine sulphonanilide ligands have been synthesized in two steps according to literature<sup>3-7</sup>.

TABLE-I

Ligand No.	Groups and their position	
	R <sup>1</sup>	R <sup>2</sup>
L <sub>1</sub>	H	<i>o</i> -NO <sub>2</sub>
L <sub>2</sub>	H	<i>m</i> -NO <sub>2</sub>
L <sub>3</sub>	H	<i>p</i> -NO <sub>2</sub>
L <sub>4</sub>	CH <sub>3</sub>	<i>o</i> -NO <sub>2</sub>
L <sub>5</sub>	CH <sub>3</sub>	<i>m</i> -NO <sub>2</sub>
L <sub>6</sub>	CH <sub>3</sub>	<i>p</i> -NO <sub>2</sub>
L <sub>7</sub>	C <sub>2</sub> H <sub>5</sub>	<i>o</i> -NO <sub>2</sub>
L <sub>8</sub>	C <sub>2</sub> H <sub>5</sub>	<i>m</i> -NO <sub>2</sub>
L <sub>9</sub>	C <sub>2</sub> H <sub>5</sub>	<i>p</i> -NO <sub>2</sub>

### Synthesis of Systems

Nine systems were prepared by using  $\text{PrCl}_3 \cdot 6\text{H}_2\text{O}$  and ligands  $L_1$  to  $L_9$  in 1 : 2 molar ratio (modified doped model) in DMF medium. Solution spectra were recorded for Pr(III)-ligand systems in the range of 400–625 nm by using standard spectrophotometer (Systronics 106).

### RESULTS AND DISCUSSION

Values of various electronic spectral parameters are presented in Tables 2–5. All the systems have been classified into three categories on the basis of symmetry parameter values:

Category A: Pr(III)- $L_7$  and Pr(III)- $L_8$

Category B: Pr(III)- $L_5$  and Pr(III)- $L_9$

Category C: Pr(III)- $L_1$ , Pr(III)- $L_2$ , Pr(III)- $L_3$ , Pr(III)- $L_4$ , Pr(III)- $L_6$

The three categories viz., A, B and C have the symmetry parameter values ( $T_4/T_6$  ratio) ranging from 0.23–0.28, 0.29–0.34 and 0.35–0.40 respectively. Each category corresponds to a different stereo-environment around lanthanide ion, i.e., the changed coordination behaviour.

The average values of nephelauxetic ratio ( $\beta$ ) and bonding parameter ( $b^{1/2}$ ) have been found to be 0.9905 and 0.0686 respectively. Nephelauxetic ratio ( $\beta < 1$ ) and positive value of bonding parameter ( $b^{1/2}$ ) (Table-6) infers covalency in metal-ligand bonding.

The value of oscillator strength for bands have been found to be 4.24–43.7 and these values were recalculated by using computed values of Judd Ofelt parameters ( $T_\lambda$ ). A close agreement between observed and calculated values of oscillator strength have been found which establishes the validity of Judd Ofelt equation. The metal-ligand interaction was also observed as there was increase in intensity of hypersensitive band ( $^3\text{H}_4 \rightarrow ^3\text{P}_2$ ).
