A new spirocyclic phosphazene derivative has been synthesized from the reaction of 1,10-phenanthroline-5,6-diol with hexachlorocyclotriphosphazatriene in suitable conditions and the Ru(II) complex of the ligand was prepared and characterized. Synthesized compounds have been investigated with the methods of FTIR, ¹H NMR, ³¹P NMR, UV-VIS, MS, fluorescence and elemental analysis.

Key Words: Spirocyclic phosphazene, Ruthenium complex, 1,10-Phenanthroline.

INTRODUCTION

In the last four decades, phosphazene derivatives attracted more attention due to considerable interest for a number of reasons *i.e.*, (i) the general preparative chemistry of a structurally relative simple trinuclear compound with the phosphorus nuclei in different chemical environments; (ii) for producing inorganic polymers with different organic and inorganic side groups¹; (iii) for the investigation of the stereogenic properties of phosphazenes^{2,3} and (iv) the further design of the highly selective anticancer⁴, antibacterial⁵ and anti HIV⁶ agents. On the other hand, they have also found applications in producing nonburning textile fibers, advanced elastomers^{7,8}, rechargeable lithium batteries^{9,10} and besides their multidimensional use as biomedical materials¹¹.

Cyclophosphazenes have attracted the attention of researchers for three main reasons. One, attention has centered on the substitution of the P-Cl bonds of chlorocyclophosphazene with many nucleophilic reagents. The stereo- and regio-selectivities involved in these reactions has been a subject of intense scrutiny. The usage of cyclophosphazenes as ligands for transition metals is another area of interest. Coordination through a ring nitrogen atom and/or an appropriately substituted ligand group can lead to a number of interesting structures¹².

A variety of cyclic phosphazene trimers containing the azido group with aryloxy, alkoxy or dialkylamino cosubstituents have been synthesized. Reaction leading to aryloxphosphazenes is the most numerous and intensively investigated in cyclophosphazene chemistry¹³⁻¹⁶.

In this work, a new spirocyclic phosphazene derivative has been synthesized from the reaction of 1,10-phenanthroline-5,6-diol with hexachlorocyclotriphosphazatriene in suitable conditions and the Ru(II) complex of the ligand was prepared and characterized. Synthesized compounds have been investigated with the methods of FTIR, ¹H NMR, ³¹P NMR, UV-visible, MS, fluorescence and elemental analysis.

EXPERIMENTAL

All the chemicals were of the highest grade available. Hexachlorocyclotriphosphazatriene (N₃P₃Cl₆) was purchased from Aldrich and recrystallized from dry hexane followed by sublimation twice before use. Tetrahydrofuran was distilled from calcium hydroxide. All experimental manipulations were carried out under argon atmosphere. FTIR spectra were recorded as KBr disks on a Mattson 1000 FTIR spectrometer. ³¹P NMR spectra were recorded with the use of Bruker AC-500 MHz (CDCl₃-d₆) spectrometer. The elemental analyses and mass spectra (MS) were determined in the TUBITAK Laboratory (Center of Science and Technology Research of Turkey). Melting points were measured with a BÜCHI melting point B-540 apparatus using a capillary tube. Fluorescence spectra were recorded on a "PTI C71 Time Resolved Spectrofluorometer".

Synthesis of 1,10-phenanthroline-5,6-dione: 1,10-Phenanthroline (5 g) was dissolved in portions during stirring in 30 mL of concentrated sulfuric acid in a 100 mL round-bottom flask equipped with a reflux condenser. Sodium bromide (2.50 g) was then added, followed by 15 mL of 70 % nitric acid. The mixture was heated to boiling and then kept

refluxing for 40 min heating was then reduced and the reflux condenser removed to allow the bromine vapors to escape during 15 min of gentle boiling. After being cooled the mixture was poured into 400 g of ice, carefully neutralized to pH 7 with about 150 mL of 10 M sodium hydroxide and allowed to stand for 0.5 h. The turbid solution was filtered and the solids were extracted with 100 mL of boiling water. The insoluble material was removed from the cooled extract by filtration and the combined aqueous solutions were extracted with 5 mL \times 100 mL dichloromethane. The organic phase was washed with 50 mL of water, dried over anhydrous sodium sulphate and evaporated under reduced pressure. The crystalline residue was recrystallized from 400 mL of toluene to give the dione: 2.64 g (45 %), yellow-orange needles, m.p. 257 °C, IR (KBr, ν_{\max} , cm^{-1}): 3060 (Ar-CH), 1702 (C=O), 1576, 738 (Ar-CH).

Synthesis of 1,10-phenanthroline-5,6-diol ($\text{C}_{12}\text{H}_8\text{N}_2\text{O}_2$): 1,10-Phenanthroline-5,6-dione (0.5 g) and hydrazine sulphate (1.1 g) were mixed in water (15 mL) and kept in a boiling water bath for *ca.* 2 min, until the vigorous evolution of the gas had ceased. Upon cooling the yellow solid was removed and washed with ethanol thoroughly to yield 83 %. The compound decomposed at 390 °C after sintering, consistent with the literature description). m.p. 280 °C, IR (KBr, ν_{\max} , cm^{-1}): 3095 (Ar-CH), 1626 (C=N), 1576, 738 (Ar-CH). Anal. calcd. (%) for $\text{C}_{12}\text{H}_8\text{N}_2\text{O}_2 \cdot 0.25\text{H}_2\text{O}$: C, 66.50; H, 3.95; N, 12.92. Found (%): C, 66.15; H, 3.878; N, 13.03. FAB (+) mass spectrum: m/z : 213 [$\text{M} + \text{H}^+$].

Synthesis of *tris*(9,10-phenanthroline-5,6-dioxy)cyclo-triphosphazene ($\text{C}_{36}\text{H}_{18}\text{N}_9\text{O}_6\text{P}_3$): 0.1272 g (0.6 mmol) 1,10-phenanthroline-5,6-diol and 0.0696 g (0.2 mmol) hexachlorocyclotriphosphazene was dissolved in dry 50 mL THF. 0.42 mL (3 mmol) triethylamine and 0.007 g tetrabutylammonium bromide was mixed with the reaction mixture. The reaction mixture was stirred at argon atmosphere. The reaction time was controlled by TLC. The solvent was filtrated and solid was washed with cold water after dried. The yellow solid was obtained: Yield 0.025 g. (16 %); m.p. 205 °C, IR (KBr, ν_{\max} , cm^{-1}): 3050 (Ar-CH), 1167 (P-O-C_{arm}), 1616 (C=N_{phen}), 1242 P=N. Anal. calcd. (%) for $\text{C}_{36}\text{H}_{18}\text{N}_9\text{O}_6\text{P}_3$ (765.5 g/mol): C, 56.48; H, 2.37; N, 16.47. Found (%): C, 55.82; H, 2.18; N, 15.97. FAB (+) MS: 765.41 [M^+]. ^1H NMR : 7.69-7.8 ppm (m, Ar-CH), 8.4-9.1 ppm (m, Ar-CH). ^{31}P NMR (CDCl_3) δ 38.2 ppm(s).

Synthesis of Ru(II) complex: To prepare the Ru(II) complex, the ligand (0.0053 g, 0.007 mmol) was dissolved in dry ethanol (20 mL) and $\text{Ru}(\text{bpy})_2\text{Cl}_2$ (0.012 g, 0.021 mmol) in 10 mL of dry ethanol was added to this solution. The mixture was stirred at 90 °C for 3 h. A dark-yellow precipitate was obtained when the solution was cooled room temperature. It was filtered off, washed with diethyl ether. Yield 0.022 g. (45 %); m.p. > 350 °C. IR (KBr, ν_{\max} , cm^{-1}): 1602 (C=N_{phen}), 1102 (P-N), 1154 (P-O-C_{arm}). Anal. calcd. (%) for $\text{C}_{66}\text{H}_{42}\text{N}_{15}\text{O}_6\text{P}_3\text{Ru}_3$ (1537.26 g/mol): C, 51.57; H, 2.75; N, 13.67. Found (%): C, 51.82; H, 2.69; N, 13.72. ^1H NMR : 8.1-8.9 ppm (m, Ar-CH), 9.2-9.5 ppm (m, Ar-CH).

RESULTS AND DISCUSSION

The new phosphazene ligand was synthesized from reaction of hexachlorocyclotriphosphazene with 1,2-dihydroxy-1,10-

phenanthroline in suitable conditions and the Ru(II) complex of the ligand was prepared and characterized as shown in **Scheme-I**. The starting compounds, 1,10-phenanthroline-5,6-dione and 1,10-phenanthroline-5,6-diol were synthesized according to literature methods^{17,18}. FTIR data gave further useful information on the structure of substances. Synthesis reaction of 1,10-phenanthroline-5,6-dione confirmed by the presence of strong C=O at 1702 cm^{-1} , Ar-CH at 1576, 738, 3060 cm^{-1} . 1,10-Phenanthroline-5,6-diol of the IR spectrum showed 3095 (Ar-CH), 1626 (C=N), 1576, 738 (Ar-CH) cm^{-1} peaks. This structure confirmed mass spectrum. The molecular ion peaks m/z 213 [$\text{M} + \text{H}^+$] was observed (Fig. 1).

Scheme-I: Formation reaction of phosphazene ligand and structure of ruthenium complex

The phosphazene ligand (C=N_{phen}) stretching bands appear at 1616 cm^{-1} for the free ligand; in the complex, these bands occur in approximately 1602 cm^{-1} , showing that the nitrogen atom of the (C=N_{phen}) group is coordinated to the metal ion.

Elemental analyses of the ligand and its Ru(II) complex show good agreement with the proposed structures. In the ^1H NMR spectrum of ligand in $\text{DMSO}-d_6$ the chemical shifts of (CH=N_{phen}) protons are observed at 8.93 ppm, while the chemical shifts of (CH=N_{phen}) protons are observed at 9.21 ppm in the Ru(II) complex.

The molecular peak m/z 765.41 [M^+] of the free ligand are present in the LC-MS spectra and support the proposed

Fig. 1. Mass spectrum of 1,10-phenanthroline-5,6-diol

structures. The most intense peak at m/z 764.43 $[M-H]^+$ corresponds to the fragment $[C_{36}H_{17}N_9P_3O_6]$. Mass spectral data confirmed the proposed structure of phosphazene ligand (Fig. 2).

Fig. 2. Mass spectrum of phosphazene ligand

The UV-visible spectral data for the ligand (L) shows high energy band at *ca.* 225-260 nm and low energy band at approximately 260-290 nm, while Ru-L complex shows low-energy band at *ca.* 225-260 nm and high energy band at approximately 260-330 nm, due to $n-\pi^*$ and $\pi-\pi^*$ transitions of the azomethine group in the ligands^{19,20}. The peaks recorded in the spectrum Ru-L are broadened and slightly red-shifted (Fig. 3).

Fig. 3. UV-visible absorption spectra of ligand (L) and Ru(II) complex in ethanol

Fluorescence spectra were recorded on a "PTI C71 time resolved spectrofluorometer" including nanoflash nitrogen arc lamp and a stroboscopic detector by the Instrumental Analysis Laboratory of Chemistry Department of Yildiz Technical University, Istanbul. In this study, by the way of several experiments with different solvents as methanol, ethanol *etc.*; optimum fluorescence intensities of ligand and metal complex at room temperature (25 °C) were obtained in DMSO and therefore the samples were prepared in it. Fluorescence measurement settings were adjusted as $\lambda_{ex} = 337$ nm, int time: 0.1 s, step size: 0.25 nm, averages: 3, slit widths: completely open and then they were compared to each other. Emission maxima of ligand and diluted and intense metal complex solutions were observed as $\lambda_{Em.Max}$ Pho = 415 nm; $\lambda_{Em.Max}$ RuPho (2×10^{-5} M) = 391nm; $\lambda_{Em.Max}$ RuPho(1×10^{-4} M) = 383 nm (Fig. 4).

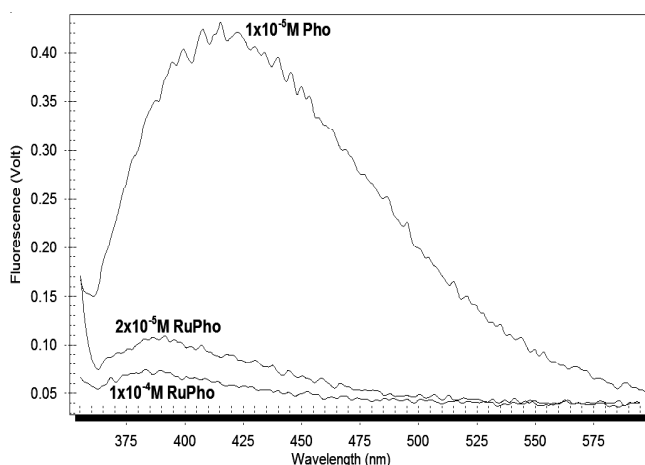

Fig. 4. Time resolved fluorescence spectra of Pho (ligand) and RuPho

The fluorescence spectra of ligand and metal complex showed that a strong static quenching and red shift in emission maxima occurred as a result of ruthenium complex of phosphazene.

Separately, in comparison of diluted and intense concentrations of metal complexes, the fluorescence intensity difference between the same metal complex curves shows consisting of a dynamic quenching.

Consequently, all the two species give fluorescence emission and the ligand phosphazene has more strong fluorescence character relatively to its ruthenium complex.
