#### Abstract

In this paper, the authors reported a theoretical investigation on molecular structure, geometry optimization, global and local chemical reactivity descriptors calculations, NBO study, DOS, non-linear optical behaviour and vibrational wavenumbers of the novel 4-[bis[2(acetyloxy)ethyl]aminolbenzaldehyde (4B2AEAB) were carried out by DFT (B3LYP and B3PW91) methods with $6-31+\mathrm{G}(\mathrm{d}, \mathrm{p}$ ) basis set in water solvent. The calculated vibrational wavenumbers are found to be in good agreement with experimental FT-IR spectra and PED analysis using GaussView 5.0 and VEDA 4 program. The UV-Vis absorption spectrum of 4B2AEAB was calculated by using TD-DFT/ B3LYP/6-31+G(d,p) in gas phase, water, $\mathrm{CHCl}_{3}$, DMSO and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solvents using CPCM model and $\lambda_{\text {max }}$ in range of 354.16, 341.35, $343.74,342.18$ and 342.64 nm , respectively. The density of state (DOS spectrum) of the compound in term of HOMOs and LUMOs and MESP were calculated and analyzed. The temperature effects on the thermodynamic properties are also discussed. The calculated ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR chemical shift using GIAO method and solvent effect are investigated by B3LYP/6-31+ $\mathrm{G}(\mathrm{d}, \mathrm{p})$ in gas phase, chloroform, water, DMSO and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solvents and correlate with experimental chemical shifts. The dipole moment, polarizability and the first static hyperpolarizability values show that the 4B2AEAB molecule is active non-linear optical (NLO) material. The nucleophilic and electrophilic reactive sites in the 4B2AEAB and its derivatives were analyzed by Fukui function analysis using Mulliken charge. The charge transfer, conjugative interactions and delocalization of electron density are analyzed by natural bond orbital (NBO) analysis. The biological properties and ADMET study of 4B2AEAB and its derivatives are also discussed.

Keywords: Molecular structure, DFT/TD-DFT, Spectroscopic properties, Non-linear optics, NBO, ADMET analysis.

## INTRODUCTION

In last two decades, rational designing of new compounds with desired properties is essential to the study of non-linear optical (NLO) materials with quadratic response in presence of electromagnetic field have been performed and become advance field of multidisciplinary research after the discovery of laser. The non-linear optical materials play important role in the field of optoelectronics and photonics and have potential applications in the areas like optical limiting, laser radiation protection, optical logic gates, optical signature processing, optical switching, harmonic generation, optical storage, optical communication, optical computing, dynamic holography, frequency mixing, etc. [1-3]. Moreover, organic materials with
extensively delocalized $\pi$-electrons have received important attention because of their massive NLO condition, field of study flexibility and simple fabrication of NLO devices [4-8]. Current research reveals that the organic NLO (non-linear optical) materials are used for developing relatively low-power laser-driven non-linear optical system. The organic non-linear optical materials exhibit quick optical response time, large nonlinear optical coefficient but high second harmonic generation (SHG) efficiency, compared to inorganic materials [9,10], to obtain the required structure and therefore the value effects are the special options of organic materials. Non-linear optical effects in organic compounds are very large as compared to inorganic compounds. This is because they have strong donoracceptor intermolecular interactions as well as delocalized $\pi$ -

[^0]electrons systems, in addition to organic materials due to flexible nature, could crystallize in a centrosymmetric (CS) or non centrosymmetric (NCS) manner with unidirectional oriented dipole moments and ability to get dissolved in various solvents [11-14]. The non-linearity in organic materials is generally governed by the nature of $\pi$-bonding sequence (donor-acceptor groups), conjugation length. The NLO properties are directly related to linear polarizability $(\alpha)$, the second order hyperpolarizability ( $\beta$ ) and the third order hyperpolarizability $(\gamma)$ arises usually from $\pi$-conjugated donoracceptor groups [15-20]. Further, from the literature survey, it is observed that the intermolecular or adduct type non-linear optical materials are crystallized in various hydrated, anhydrous and solvents. Many combinations of thiourea, phenolate, benzoate, pyridine and aldehyde related organic materials given the literature and has explored exten-sively for their efficacious non-linear optical (NLO) properties [2129]. The inter-molecular or hydrogen bonded, adduct and aldehyde related NLO materials such as 4-(dimethylamino) benzaldehyde [30], thiourea 4-(dimethyl-amino)benzaldehyde [31], 4-dimethylamino benzaldehyde 4-nitrophenol [32], 4-chloro-3-nitroaniline-3-hydroxybenzaldehyde and other intermolecular NLO materials like 4-acetylanilinium dihydrogen phosphate (4AADP) [33], urea-4-dimethyl-aminopyridine [33] are given in the literature. In present study, we have rationally designed that three novel NLO materials namely 4-[bis[2(acetyloxy)ethyl]amino]benzaldehyde (4B2AEAB), O-H-O hydrogen bonded 4-[bis[2-(acetyloxy)-ethyl]amino]benzaldehyde 4-nitrophenol (4B2AEAB4NP), 4-[bis[2-(acetyloxy)ethyl]amino]benzaldehyde thiourea (4B2AEABTU). Naeem et al. [34] reported that various charge transfer phenomena in 4-(dimethylamino)benzaldehyde (electron donor) and 4-nitrophenol (electron acceptor) complex. Herein, 4-nitrophenol and its derivatives are promising NLO materials typical example of D- $\pi$-A (donor- $\pi$-acceptor) system [35]. Herein, we also used thiourea $\left(\mathrm{CH}_{4} \mathrm{~N}_{2} \mathrm{~S}\right)$ as an organic compound, which has orthorhombic crystal structure system with centrosymmetric, Pnma, space group [36]. Thiourea has intermolecular charge transfer (ICT) property within the molecule because contains both electron acceptor and withdrawing groups. The interesting property of ICT causes enhancement of NLO response while combing with both organic molecules. Herein, we are searching new organic non-linear optical (NLO) materials for the design of applications of optoelectronic devices. Here, we are studied three novel NLO materials such as 4-[bis[2-(acetyloxy)ethyl]amino]benzaldehyde (4B2AEAB) and remaining two hydrogen bonded 4-[bis[2-(acetyloxy)ethyl]amino]benzaldehyde 4-nitro phenol (4B2AEAB4NP) and 4-[bis[2-(acetyloxy)ethyl]amino]benzaldehyde thiourea (4B2AEABTU).

In this paper, we present the spectroscopic properties such as vibrational spectra (IR), ${ }^{1} \mathrm{H} \&{ }^{13} \mathrm{C}$ NMR chemical shifts, UV-visible spectral parameters, molecular geometrical properties, NBO analysis, atomic charges, HOMO and LUMO properties, DOS spectrum, MESP, NLO properties and tempe-rature effect on thermodynamic properties of 4-[bis[2-(acetyloxy)ethyl]amino]benzaldehyde (4B2AEAB) molecule. The theoretical spectroscopic investigations well supported by experi-
mental method taken from literature. The quantum chemical investigations were performed by means of DFT/B3LYP and DFT/B3PW91 method with the $6-31+G(d, p)$ basis set. The comparative analysis of non-linear optical (NLO) properties of 4B2AEAB molecule and its derivatives are discussed. We are also investigate the in silico biological properties and ADME/ T analysis in detail. Additionally, the quantum chemical computations provide a more satisfactory results and powerful support for theoretical studies.

## EXPERIMENTAL

Structure and spectra: The optimized molecular structure of 4-[bis[2-(acetyloxy)ethyl]amino]benzaldehyde (4B2AEAB) and its derivatives (4B2AEAB4NP and 4B2AEABTU) is shown in Fig. 1. The experimental FT-IR spectrum wavenumbers of 4B2AEAB molecule is conducted to in the range of 4000-400 $\mathrm{cm}^{-1}$ with spectral resolution of $4 \mathrm{~cm}^{-1}$ and found to match well with theoretically calculated wavenumbers in water solvent. The experimental FT-IR, ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra in $\mathrm{CDCl}_{3}$ solvent of 4B2AEAB molecule are reported at Sigma-Aldrich website [37].

Computational details: The DFT computations of geometry optimization, IR wavenumbers (using B3LYP and B3PW91 method in water solvent), ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR chemical shifts (using B3LYP method in $\mathrm{CHCl}_{3}$, gas, water, DMSO and DCM), UVvisible spectroscopic parameters (using B3LYP method in water, DMSO, DCM, $\mathrm{CHCl}_{3}$ and gas phase), global and local properties analyses, NBO study, NLO properties, atomic charges, FMOs analyses and temperature effect on thermodynamic properties analysis of 4B2AEAB molecule and its derivatives were done using Gaussian 09 Revision-A02 program package [38]. The theoretically calculated results were visualized by via Gauss View 5.0.8 program [39].

The theoretical computations were performed density functional theory (DFT) method with Becke's 3-parameter exchange correlation-functional (B3) combined with correlation functional of Lee, Yang and Parr (LYP) (B3LYP) and B3 exchange correlation-functional combined with gradientcorrected correlation functional of Perdew and Wang's 1991 (B3PW91) method with 6-31+G(d,p) basis set in water solvent using CPCM model in build in Gaussian 09 Revision-A02 program package used for geometry optimization, IR wavenumbers $\left(\mathrm{cm}^{-1}\right)$, global and local chemical properties and thermodynamic properties calculations. The elaborated vibrational assignments were performed on the idea of potential energy distributions (PED) analysis using VEDA 4 program [40] and visualized by using Gauss View 5.0 program. The theoretically calculated vibrational wavenumbers were scaled with 0.964 for B3LYP/6-31+G(d,p) and 0.960 scaling factor for B3PW91/ $6-31+\mathrm{G}(\mathrm{d}, \mathrm{p})$ level [41] and the calculated wavenumbers of 4B2AEAB molecule were correlate with experimental FT-IR spectrum. The proton and carbon- 13 NMR chemical shifts of 4B2AEAB molecule were calculated using DFT/6-31+G(d,p) in the gas phase, water, $\mathrm{CHCl}_{3}$, DMSO and DCM solvent in C-PCM model and the calculated chemical shifts showing good agreement with experimental ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR chemical shifts in $\mathrm{CDCl}_{3}$ solvent and using gauge invariant atomic orbital

Fig. 1. Chemical structure and optimized molecular structure of 4B2AEAB (1A \& 1B), 4B2AEAB4NP (2A \& 2B) and 4B2AEABTU (3A \& 3B), respectively
(GIAO method) approach [42,43]. The UV-visible absorption spectrum of 4B2AEAB and its derivatives computed were done using TD-DFT/6-31+G(d,p) method in the gas phase and in water, DMSO, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and $\mathrm{CHCl}_{3}$ solvent using CPCM model and water solvent used for the derivatives. According to FMOs, the computed HOMO and LUMO energies values and their shapes of 4B2AEAB and its derivatives were simulated using DFT (B3LYP and B3PW91) using 6-31+G(d,p) basis set in
water solvent. The computed frontier molecular orbitals (FMOs) like HOMO and LUMO energy values of 4B2AEAB molecule, the various molecular (Global) properties such as electron affinity (A), ionization potential (I), chemical hardness ( $\eta$ ), chemical potential ( $\mu$ ), softness (S), electrophilicity index ( $\omega$ ) and $\mathrm{Q}_{\text {max }}$ were computed. The calculation of local chemical reactivity descriptors such as Fukui function (FF) analyses using neutral, cationic and anionic charge densities (Mulliken
population analysis) of 4B2AEAB molecule were computed at DFT (B3LYP \& B3PW91) with $6-31+G(d, p)$ level in water solvent. The non-linear optical (NLO) properties of 4B2AEAB, 4B2AEAB4NP and 4B2AEABTU molecules such as the mean polarizability $(\alpha)$, the anisotropy of the polarizability $(\Delta \alpha)$, first hyperpolarizability tensor $(\beta)$ and second hyperpolarizability tensor $(\gamma)$ were analyzed. The NBO analysis was done to understand the intermolecular charge transfer (ICT) or hyperconjugation interactions and interactions among bonds of 4B2AEAB molecule. The density of state (DOS), 2D-contour map plot and its 3D-MESP surface map was simulated using optimized geometry of 4B2AEAB molecule and its derivatives. The thermodynamic properties like thermal energy (E), heat capacity $\left(\mathrm{C}_{\mathrm{v}}\right)$ and entropy $(\mathrm{S})$ etc. and the temperature effect on thermodynamic properties were computed using DFT/B3LYP/ $6-31+G(d, p)$ level in water solvent. Finally, in silico ADMET and biological properties analysis of 4B2AEAB molecule and its derivatives were done using free online server (Molinspiration, SwissADME and preADMET server).

## RESULTS AND DISCUSSION

Geometry optimization and molecular structure: The electronic structure of rationally designed novel non-linear optical materials such as 4-[bis[2-(acetyloxy)ethyl]amino]benzaldehyde (4B2AEAB) and hydrogen bonded adduct 4-[bis[2-(acetyloxy)ethyl]amino]benzaldehyde 4-nitro phenol (4B2AEAB4NP) and 4-[bis[2-(acetyloxy)ethyl]amino]benzaldehyde thiourea (4B2AEABTU) have been investigated, in order to assess the effect of addition of 4-nitophenol and thiourea (it has both electron acceptor and electron withdrawing
groups) with organic molecule (4B2AEAB molecule) via H -bond for the enhancement of non-linear optical (NLO) response. The optimized molecular structure of 4B2AEAB molecule and its derivatives with the numbering scheme of the atoms are shown in the Fig. 1. The ground state energies and optimized geometric parameters of the 4B2AEAB molecule and its derivatives are given in the Table-1 and Table-2a-c, respectively. As seen in Table-2a-c, the calculated bond lengths of C2-C3 and C5-C6 are about $1.385 \AA, 1.383 \AA$ in B3LYP and $1.383 \AA, 1.381 \AA$ in B3PW91. The bond lengths C1-C2 and C3-C4 are largest about $1.408 \AA, 1.422 \AA$ in B3LYP and $1.405 \AA, 1.419 \AA$ in B3PW91 due to - CHO group attached from C 1 carbon atom and amino group attached from C 4 carbon atom. The bond lengths in $\mathrm{C} 1-\mathrm{C} 11$ and $\mathrm{C} 4-\mathrm{N} 35$ are about 1.456 $\AA, 1.381 \AA$ in B3LYP and $1.454 \AA, 1.375 \AA$ in B3PW91. The hydrogen bond lengths $\mathrm{O} 12-\mathrm{H} 55$ in intermolecular H -bonded derivatives like 4B2AEAB4NP molecule are about $1.6333 \AA$ and O12-H44 bond length in 4B2AEABTU molecule are about $2.001 \AA$ in B3LYP level.

The bond angles around C 1 atom are $\mathrm{C} 2-\mathrm{C} 1-\mathrm{C} 11=119.86^{\circ}$ and $119.87^{\circ}, \mathrm{C} 6-\mathrm{C} 1-\mathrm{C} 11=122.36^{\circ}$ and $122.26^{\circ}, \mathrm{C} 1-\mathrm{C} 11-\mathrm{O} 12$ $=125.78^{\circ}$ and $125.69^{\circ}$ at B3LYP and B3PW91 of 4B2AEAB, respectively and bond angle around C 4 atom are C3-C4-N35 $=121.79^{\circ}$ and $121.72^{\circ}, \mathrm{C} 5-\mathrm{C} 4-\mathrm{N} 35=121.09^{\circ}$ and $121.05^{\circ}$, $\mathrm{C} 4-\mathrm{N} 35-\mathrm{C} 14=121.04^{\circ}$ and $121.00^{\circ}, \mathrm{C} 14-\mathrm{N} 35-\mathrm{C} 25=122.10^{\circ}$ and $122.08^{\circ}, \mathrm{C} 15-\mathrm{C} 14-\mathrm{N} 35=112.52^{\circ}$ and $112.27^{\circ}, \mathrm{C} 26-\mathrm{C} 25-$ $\mathrm{N} 35=115.48^{\circ}$ and $115.35^{\circ}$ at B3LYP and B3PW91 of 4B2AEAB, respectively. The selected bond angles of 4B2AEAB4NP are $\mathrm{C} 11-\mathrm{O} 12-\mathrm{H} 55=121.0296^{\circ}, \mathrm{C} 43-\mathrm{O} 51-\mathrm{H} 55=112.5006^{\circ}$ and bond angle of 4B2AEABTU are C11-O12-H44 $=137.9002^{\circ}$ at B3LYP level. These asymmetries of bond angle reveals that the conjugation with the acetyloxy ethylamino side chain in 4B2AEAB molecule, conjugation with the 4-nitrophenol by hydrogen bond in 4B2AEAB4NP molecule and conjugation with the thiourea by hydrogen bond in 4B2AEABTU molecule take place resulting from the charge transfer interactions within the molecule and this type of properties increase the non-linear optical as well as biological property of the molecule. From Table 2 b and 2 c , the torsion angles of 4B2AEAB molecule are $\mathrm{C} 2-\mathrm{C} 1-\mathrm{C} 11-\mathrm{O} 12=179.637^{\circ}$ and $179.624^{\circ}$, $\mathrm{C} 6-\mathrm{C} 1-\mathrm{C} 11-$ $\mathrm{O} 12=0.1934^{\circ}$ and $0.1657^{\circ}$, C2-C3-C4-N35 $=-178.313^{\circ}$ and $-178.233^{\circ}$, N35-C4-C5-C6 $=178.411^{\circ}$ and $178.309^{\circ}$, N35-
$\mathrm{C} 14-\mathrm{C} 15-\mathrm{O} 36=-177.877^{\circ}$ and $-177.672^{\circ}$, N35-C25-C26-O38 $=65.485^{\circ}$ and $65.435^{\circ}$ and O37-C20-O36-C15 $=-0.1721^{\circ}$ and $-0.2086^{\circ}$ in B3LYP and B3PW91 level. The selected dihedral angles of H-bonded 4B2AEAB4NP molecule are C1-C11$\mathrm{O} 12-\mathrm{H} 55=179.0978^{\circ}$ and $\mathrm{H} 13-\mathrm{C} 11-\mathrm{O} 12-\mathrm{H} 55=-0.7716^{\circ}$ and in H-bonded 4B2AEABTU molecule the dihedral angle are $\mathrm{C} 1-\mathrm{C} 11-\mathrm{O} 12-\mathrm{H} 44=174.5408^{\circ}$ and $\mathrm{H} 13-\mathrm{C} 11-\mathrm{O} 12-\mathrm{H} 44=-1.345^{\circ}$ at B3LYP level shown in Table-2c. The above geometrical investigation of 4B2AEAB molecule and its derivatives shows that the variation in the bond lengths, bond angles and dihedral angles shows polymorphism this is most important property of organic compounds. Polymorphism is the most important factor for pharmaceutical industries [44], in the field of optoelectronic and photonics industries.

Vibrational frequency analysis: The molecule 4B2AEAB, 4B2AEAB4NP and 4B2AEABTU consist of 40, 55 and 48 atoms belongs to $\mathrm{C}_{1}$ point group symmetry and has 114,159 and 138 normal modes of fundamental vibrations, respectively. The comparative analysis of fundamental modes of vibrations with FT-IR (capillary cell technique = neat) wavenumbers and theoretically calculated wavenumbers (unscaled and scaled), IR intensities of 4B2AEAB using (B3LYP and B3PW91 levels) 4B2AEAB4NP (B3LYP) and 4B2AEABTU (B3LYP) with 6-
$31+\mathrm{G}(\mathrm{d}, \mathrm{p})$ basis set in water solvent using CPCM model and visualized and assigned by GaussView 5.0.8 and VEDA 4 program are reported in Table-3a-c. The theoretically calculated wavenumbers are greater than experimental wavenumbers due to correlation effect of basis set and electrons inadequacy. For this reason, theoretically calculated wavenumbers were scaled with 0.9648 (for B3LYP/6-
$31+\mathrm{G}(\mathrm{d}, \mathrm{p})$ level) and 0.9602 (for B3PW91/6-31+G(d,p) level) [41]. The spectra of the title molecule (4B2AEAB) and its H bonded derivatives are shown in Fig. 2.

C-H vibrations: In aromatic and heterocyclic aromatic compounds, C-H stretching band appear in the range 3100$3000 \mathrm{~cm}^{-1}$ and the C-H in-plane and out-of-plane bending vibrations are observed in the range of $1300-1000 \mathrm{~cm}^{-1}$ and $900-675$

TABLE-3a
OBSERVED FT-IR AND CALCULATED WAVENUMBERS USING B3LYP AND B3PW91 WITH 6-31+G (d, p) BASIS SET FOR 4B2AEAB MOLECULE IN WATER SOLVENT USING CPCM MODEL

| Mode | Experimental FT-IR $\left(\mathrm{cm}^{-1}\right)$ | B3LYP Wavenumber ( $\mathrm{cm}^{-1}$ ) |  | B3PW91 Wavenumber ( $\mathrm{cm}^{-1}$ ) |  | IR intensity | Assignments |

Fig. 2. IR-spectrum plot A and B of 4B2AEAB at B3LYP and B3PW91, plot C FT-IR spectrum of $4 B 2 A E A B$ at $C D C l_{3}$ [37], plot D of 4B2AEAB4NP at B3LYP and plot E of 4B2AEABTU at B3LYP level in water solvent
$\mathrm{cm}^{-1}$ given in the literature [45], respectively. The calculated IR wavenumbers were observed in the range of 3133-3068 $\mathrm{cm}^{-1}$ and 3121-3069 $\mathrm{cm}^{-1}$ at B3LYP and B3PW91 level, respectively and the $\mathrm{C}-\mathrm{H}$ stretching vibrations which correlated well with the experimental FT-IR band was observed at $3050 \mathrm{~cm}^{-1}$. The C-H stretching vibrations in $s p^{3}$ hybridized molecule were appearing in the range of $3000-2800 \mathrm{~cm}^{-1}$ [45]. In present study, the calculated $\mathrm{C}-\mathrm{H}$ stretching bands appear in the range of 3065-2885 and 3068-2873 $\mathrm{cm}^{-1}$ at B3LYP and B3PW91 level, respectively and correlated with experimental FT-IR bands observed in the range of $2900-2740 \mathrm{~cm}^{-1}$. The calculated C-H in-plane bending and out-of-plane vibrations at B3LYP and B3PW91 were observed at $1322 \& 1327 \mathrm{~cm}^{-1}$ and $991 \& 981$ $\mathrm{cm}^{-1}$, respectively, which correlated well with the experimental FT-IR band observed at $1320 \mathrm{~cm}^{-1}$ of in-plane vibrations and $910 \mathrm{~cm}^{-1}$ of out-of plane vibrations. The C-H stretching vibration of aldehyde with strong intensity appear in two bands in region 2850-2820 and 2750-2720 $\mathrm{cm}^{-1}$ [45] and in the present study, the calculated C-H stretching vibration observed in region 2885-2873 $\mathrm{cm}^{-1}$ with strong intensity in B3LYP and B3PW91 level, respectively and correlated well with experimental FT-IR bands observed in region $2740 \mathrm{~cm}^{-1}$.
$\mathbf{C = O}$ and $\mathbf{C - O}$ vibrations: The band due to $\mathrm{C}=\mathrm{O}$ stretching vibration of aromatic aldehyde were observed in the region $1740-1720 \mathrm{~cm}^{-1}$ and $\mathrm{C}=\mathrm{O}$ of ester appear in region 1750$1700 \mathrm{~cm}^{-1}$ [45]. In present study, the calculated $\mathrm{C}=\mathrm{O}$ stretching vibration of aromatic aldehyde and ester side chain of 4B2AEAB were observed at B3LYP and B3PW91 $1691 \mathrm{~cm}^{-1}$ and $1690-1641 \mathrm{~cm}^{-1}$ and $1706 \mathrm{~cm}^{-1}$ and $1703-1653 \mathrm{~cm}^{-1}$, respectively and correlate well with experimental FT-IR bands observed in region $1740 \mathrm{~cm}^{-1}$ and $1680-1600 \mathrm{~cm}^{-1}$ of aromatic aldehyde and ester side chain, respectively.

C-C and C-N vibrations: The ring C-C stretching vibrations lie in the region $1600-1400 \mathrm{~cm}^{-1}$ with medium, week and variable intensity [45] and according to Versanyi [46], the five bands lie in the region 1625-1590, 1590-1575, 1540-1470, $1465-1430$ and $1380-1280 \mathrm{~cm}^{-1}$. In present study, the calculated five C -C stretching vibrations of 4B2AEAB at B3LYP and B3PW91 were found in the region 1573-1526, 1469-1423, 1294-1223, $1204,1148-1113 \mathrm{~cm}^{-1}$ and 1579-1532, 1454-1419, 1280-1225, 1200, 1142-1106, respectively and all five bands show good agreement with experimental FT-IR band lie in range 1550-1530, 1450-1440, 1230, 1170, $1130 \mathrm{~cm}^{-1}$. According to Sundaraganesan et al. [47] assigned the $\mathrm{C}-\mathrm{N}$ stretching vibrations at $1302 \mathrm{~cm}^{-1}$ and Kumar and Ramasamy [48] have assigned C-N stretching band at $1256 \mathrm{~cm}^{-1}$. The calculated C-N stretching band assigned at B3LYP and B3PW91 level in region 1322, 1160, 1327 and $1161 \mathrm{~cm}^{-1}$, respectively and the observed peak agreed well with the experimental FT-IR values at $1320 \mathrm{~cm}^{-1}$. The C-N stretching vibrations of 4B2AEAB4NP and 4B2AEABTU compounds appear in the region 1373 and $1415 \mathrm{~cm}^{-1}$, respectively (Table3 b and 3 c ).
$\mathrm{N}-\mathrm{H}$ and C-S vibrations: In the all heterocyclic organic compounds the $\mathrm{N}-\mathrm{H}$ stretching vibrations found in the region $3500-3300 \mathrm{~cm}^{-1}$ [49]. From literature survey, Sathiya et al. [31] showed the $\mathrm{N}-\mathrm{H}$ stretching vibrations in the region 3370 $\mathrm{cm}^{-1}$ and $3391 \mathrm{~cm}^{-1}$ in experimental FT-IR. In this work, the
$\mathrm{N}-\mathrm{H}$ stretching vibrations occur in the region $3585-3540 \mathrm{~cm}^{-1}$ in theoretically calculated wavenumbers of 4B2AEABTU compound at B3LYP/6-31+G(d,p) basis set in water solvent reported in Table-3c. The C-S stretching vibrations appear in the range of $930-670 \mathrm{~cm}^{-1}$ was given in literature [50]. The FT-IR bands appear in the region $728 \mathrm{~cm}^{-1}$ [31] and the calculated C-S stretching vibrations of 4B2AEABTU appear in the region $712 \mathrm{~cm}^{-1}$ at B3LYP/6-31+G(d,p) basis set in water solvent given in Table-3c. The above values of literature and experimental FT-IR matched well with the theoretical wavenumbers.
$\mathrm{N}-\mathrm{O}$ and $\mathrm{O}-\mathrm{H}$ vibrations: The $\mathrm{N}-\mathrm{O}$ stretching bands appear in $1585-1498 \mathrm{~cm}^{-1}$ region [32], while the N-O stretching vibrations of intermolecular hydrogen bonded 4B2AEAB4NP calculated at B3LYP/6-31+G(d,p) basis set in water solvent occur in the region $1491,1468,1433 \mathrm{~cm}^{-1}$ and symmetrical stretching vibration found in the region $1298 \mathrm{~cm}^{-1}$ due to $-\mathrm{NO}_{2}$ group of phenol match well with FT-IR bands [32] appeared at 1370 $\mathrm{cm}^{-1}$ due to symmetrical stretching mode of $-\mathrm{NO}_{2}$ group of phenol. The O-H stretching vibrations appeared at $3086 \mathrm{~cm}^{-1}$ [32] and in the present study, the $\mathrm{O}-\mathrm{H}$ stretching bands assigned in the region 2966-2960, 2889 and $1587 \mathrm{~cm}^{-1}$ due to the intermolecular hydrogen bonding where the -OH stretching bands is expected to shift towards lower frequency calculated at B3LYP level and matched well with experimental FT-IR bands.

NMR spectral analysis: Nuclear magnetic resonance (NMR) is the powerful technique for conformational analysis of organic and inorganic compounds [51,52]. The optimized structure of title molecule (4B2AEAB) was affirmed by ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR chemical shifts by employing DFT/B3LYP/6$31+\mathrm{G}(\mathrm{d}, \mathrm{p})$ basis set in the gas phase and solvents $\left(\mathrm{CHCl}_{3}\right.$ water, DMSO and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) using CPCM model and compared with experimental [37] ${ }^{1} \mathrm{H} \&{ }^{13} \mathrm{C}$ chemical shifts (in $\mathrm{CDCl}_{3}$ ). The theoretical and experimental ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR chemical shifts values are summarized in Table-4. The observed ${ }^{1} \mathrm{H}$ NMR spectrum of 4B2AEAB shows the presence of one distinct singlet appeared at $\delta 2.04 \mathrm{ppm}$ of $-\mathrm{OOC}-\left(\mathrm{CH}_{3}\right)$ methyl proton of 4-[bis[2-(acetyloxy)ethyl]-amino]benzaldehyde (4B2AEAB) and the theoretical chemical shift values of protons of methyl group for $\mathrm{H} 22, \mathrm{H} 23, \mathrm{H} 24$ and $\mathrm{H} 33, \mathrm{H} 34, \mathrm{H} 40$ atoms in $\mathrm{CHCl}_{3}$, gas phase, water, DMSO and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solvents appeared at 1.72$2.12 \mathrm{ppm}, 1.56-2.01 \mathrm{ppm}, 1.77-2.03 \mathrm{ppm}, 1.78-2.10 \mathrm{ppm}$ and $1.74-2.09 \mathrm{ppm}$ and $1.46-1.56 \mathrm{ppm}, 1.28-1.54 \mathrm{ppm}, 1.51-1.57$ $\mathrm{ppm}, 1.52-1.58 \mathrm{ppm}$ and $1.49-1.56 \mathrm{ppm}$, respectively and other singlet appeared in deshielded at $\delta 9.71 \mathrm{ppm}$ is to CH proton of carbonyl group of 4B2AEAB and calculated chemical shift of C - H 13 proton in $\mathrm{CHCl}_{3}$, gas phase, water, DMSO and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solvent appeared at $9.71 \mathrm{ppm}, 10.40 \mathrm{ppm}, 10.43 \mathrm{ppm}, 10.39$ $\mathrm{ppm}, 10.396 \mathrm{ppm}$ and 10.40 ppm , respectively. In the aromatic ring, four doublets correspond to protons of aromatic -CH group of $4 B 2 A E A B$ ring. The simulated ${ }^{1} \mathrm{H}$ NMR spectrum of 4B2AEAB compound is shown in Fig. 3a.

Further, ${ }^{13} \mathrm{C}$ NMR spectrum exhibits the distinct signals at $\delta 190.27 \mathrm{ppm}, \delta 170.84 \mathrm{ppm}$ and $\delta 20.76 \mathrm{ppm}$ for $\mathrm{C}=\mathrm{O}$ group of aldehyde, two acetyloxy groups and two $-\mathrm{CH}_{3}$ groups of 4B2AEAB, respectively. The calculated chemical shift of $\mathrm{C}=\mathrm{O}$ of aldehyde of 4 B 2 AEAB in $\mathrm{CHCl}_{3}$, gas phase, water, DMSO and DCM solvents appeared at $189.53 \mathrm{ppm}, 186.22$

Fig. 3a. Simulated and correlated ${ }^{1} \mathrm{H}$ NMR spectrum of the title molecule 4B2AEAB at experimental in $\mathrm{CDCl}_{3}[37]$ and DFT/B3LYP/6$31+\mathrm{G}(\mathrm{d}, \mathrm{p})$ in gas phase and different solvent using CPCM model
ppm, 190.54 ppm 190.50 ppm and 190.03 ppm , respectively and the calculated chemical shift of $\mathrm{C}=\mathrm{O}$ of acetyloxy in $\mathrm{CHCl}_{3}$, gas phase, water, DMSO and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solvents groups appeared at $183.29-183.6 \mathrm{ppm}, 180.34-180.75 \mathrm{ppm}, 184.18-$ $184.45 \mathrm{ppm}, 184.14-184.42 \mathrm{ppm}$ and $183.72-184.02 \mathrm{ppm}$, respectively. From Table-4b, it is clear that the calculated chemical shift shows good agreement with experimental ${ }^{13} \mathrm{C}$ NMR chemical shift (in $\mathrm{CDCl}_{3}$ ). The simulated ${ }^{13} \mathrm{CNMR}$ spectrum of 4 B 2 AEAB compound is shown in Fig. 3b.

UV-visible analysis: The time dependent-density functional theory (TD-DFT) computational methods are well known and broadly engaged in the calculation of electronic spectra of compounds. In present study, one electron excitations between the molecular orbitals are generally explains the transition from ground state to excited state. This analysis provides excited state

Fig. 3b. Simulated and correlated ${ }^{13} \mathrm{CNMR}$ spectrum of 4B2AEAB compound analyzed in $\mathrm{CDCl}_{3}[37]$ and $\mathrm{DFT} / \mathrm{B} 3 \mathrm{LYP} / 6-31+\mathrm{G}(\mathrm{d}, \mathrm{p})$ in gas phase and different solvent using CPCM model
molecular geometry, absorption maxima $\left(\lambda_{\max }\right)$, oscillator strengths (f), excitation energy ( $\mathrm{E}_{\mathrm{ex}}$ ), major contributions to electronic transitions and three major excitations of 4B2AEAB and its H-bonded derivatives. The UV-visible spectral analysis of 4B2AEAB and its derivatives were calculated by using TD-DFT method with $6-31+G(d, p)$ basis set in gas phase and solvent phase using CPCM model. The UV data and parameters are summarized in Table-5a and 5b. The UV-visible spectra of 4B2AEAB and its H -bonded derivatives (4B2AEAB4NP and 4B2AEABTU) are shown in Fig. 4a-c. From Table-5a, the theoretical absorption wavelength $\left(\lambda_{\max }\right)$ at 354.16 nm has 0.0013 oscillator strength and major contribution is $\mathrm{H}-2 \rightarrow \mathrm{~L}(93 \%), \mathrm{H} \rightarrow \mathrm{L}(2 \%)$.

Another absorption wavelength in chloroform solvent is 343.74 nm with 0.0287 (O.S.) and major contribution of orbitals is $\mathrm{H}-3 \rightarrow \mathrm{~L}(23 \%), \mathrm{H}-2 \rightarrow \mathrm{~L}(57 \%), \mathrm{H} \rightarrow \mathrm{L}(16 \%)$ of the title molecule. The increasing order of wavelength $\left(\lambda_{\max }\right)$ of

4B2AEAB are $354.16 \mathrm{~nm}>343.74 \mathrm{~nm}>342.64 \mathrm{~nm}>342.18$ $\mathrm{nm}>341.88 \mathrm{~nm}$ in gas phase, chloroform, dichloromethane, dimethyl sulfoxide and water solvent, respectively. From Table$5 b$, it is observed that in donor- $\pi$-acceptor adduct 4B2AEAB4NP molecule, the absorption wavelength $\left(\lambda_{\max }\right)$ at 388 nm has 0.0152 oscillator strength and major contribution of HOMO and LUMO are $\mathrm{H} \rightarrow \mathrm{L}(99 \%)$ in water solvent. The $\lambda_{\text {max }}$ of 4B2AEAB4NP molecule increasing order is water $>$ gas phase. Another donor- $\pi$-acceptor 4B2AEABTU molecule the wavelength ( $\lambda_{\text {max }}$ ) observed at 644.75 nm has 0.000 oscillator strength and the major contributions of orbitals are $\mathrm{H} \rightarrow \mathrm{L}(99 \%)$ in gas phase and 462.43 nm in water solvent has 0.0036 oscillator strength and the major contributions of frontier molecular orbitals (FMOs) are $\mathrm{H} \rightarrow \mathrm{L}(52 \%), \mathrm{H} \rightarrow \mathrm{L}+1$ ( $47 \%$ ).

Natural bond orbital (NBO) analysis: NBO analysis has been performed on the title molecule at DFT/B3LYP/6$31+G(d, p)$ level of theory in the gas phase in order to explain inter and intramolecular interactions, charge transfer within the molecule, second order perturbation theory analysis of Fock matrix for the title molecule (4B2AEAB). NBO analysis gives an effective tool for studying 'natural Lewis structure' because all orbitals of molecule include the highest possible percentage of electron density (ED). NBOs also help in studying inter-and intramolecular interactions as well as charge transfer or conjugative interactions in different molecular systems [53]. The strength of delocalization interaction (or stabilization energy) $\mathrm{E}^{(2)}$ shows the strength of interaction in between electron donors and electron acceptors, i.e., as the value of stabilization energy $\mathrm{E}^{(2)}$ increase the strength of interaction increase and vice-versa, more intensive is the interaction between donor and acceptor, the greater the extent of conjugation of the whole system. The stabilization energy $\mathrm{E}^{(2)}$ between donor and acceptor is resolved by utilizing the second order energy lowering relation as [54]:

$$
\begin{equation*}
\mathrm{E}^{(2)}=\Delta \mathrm{E}_{\mathrm{ij}}=\mathrm{q}_{\mathrm{i}} \frac{\left(\mathrm{~F}_{\mathrm{ij}}\right)^{2}}{\left(\mathrm{E}_{\mathrm{j}}-\mathrm{E}_{\mathrm{i}}\right)} \tag{1}
\end{equation*}
$$

where $\mathrm{q}_{\mathrm{i}}$ is the donor orbital occupancy (or population of donor orbital), the off-diagonal Fock is asserted as $\mathrm{F}_{\mathrm{ij}}$ or Kohn-Sham matrix element between i and j NBO orbitals. The results of second order perturbation theory analysis of Fock matrix for 4B2AEAB are listed in Table-6. NBO analysis of 4B2AEAB indicates the intramolecular interactions and interaction between donor and acceptor will be intense due to the increase of stabilization energy $\mathrm{E}^{(2)}$. According to the stabilization energy $\mathrm{E}^{(2)}$ values of 4B2AEAB, the following transitions are occurred; $\pi(\mathrm{C} 1-\mathrm{C} 2) \rightarrow \pi^{*}(\mathrm{C} 3-\mathrm{C} 4 / \mathrm{C} 5-\mathrm{C} 6 / \mathrm{C} 11-\mathrm{O} 12)(15.98 / 22.40 / 29.23$ $\mathrm{kcal} / \mathrm{mol}), \pi(\mathrm{C} 3-\mathrm{C} 4) \rightarrow \pi^{*}(\mathrm{C} 1-\mathrm{C} 2 / \mathrm{C} 5-\mathrm{C} 6 / \mathrm{C} 5-\mathrm{C} 6)(28.84 / 13.19 /$ $183.10 \mathrm{kcal} / \mathrm{mol}), \pi(\mathrm{C} 5-\mathrm{C} 6) \rightarrow \pi^{*}(\mathrm{C} 1-\mathrm{C} 2 / \mathrm{C} 3-\mathrm{C} 4)(13.45 / 20.77$ $\mathrm{kcal} / \mathrm{mol}$ ) and these transition take place within the benzene
ring of the title molecule (4B2AEAB). The $\sigma(\mathrm{C} 21-\mathrm{H} 24)$ $\rightarrow \pi^{*}(\mathrm{C} 20-\mathrm{O} 37)(4.66 \mathrm{kcal} / \mathrm{mol})$ this transition reveals that it take place within the acetyl group of 4B2AEAB side chain molecule. In addition, the major transitions between lone pairs are also occurred; $\mathrm{LP}(2) \mathrm{O} 12 \rightarrow \sigma^{*}(\mathrm{C} 1-\mathrm{C} 11 / \mathrm{C} 11-\mathrm{H} 13)(16.85 /$ $19.55 \mathrm{kcal} / \mathrm{mol}), \mathrm{LP}(1) \mathrm{N} 35 \rightarrow \pi^{*}(\mathrm{C} 3-\mathrm{C} 4)(46.51 \mathrm{kcal} / \mathrm{mol})$ $\sigma^{*}(\mathrm{C} 14-\mathrm{C} 15 / \mathrm{C} 25-\mathrm{C} 26)(6.43 / 6.73 \mathrm{kcal} / \mathrm{mol}), \mathrm{LP}(1) \rightarrow \sigma^{*}(\mathrm{C} 20-$ O37) ( $8.92 \mathrm{kcal} / \mathrm{mol}$ ), LP(2) O36 $\rightarrow \pi^{*}(\mathrm{C} 20-\mathrm{O} 37)(50.35 \mathrm{kcal} /$ $\mathrm{mol}), \mathrm{LP}(2) \mathrm{O} 37 \rightarrow \sigma^{*}(\mathrm{C} 20-\mathrm{O} 36)(33.10 \mathrm{kcal} / \mathrm{mol}), \mathrm{LP}(2)$ $\mathrm{O} 38 \rightarrow \pi^{*}(\mathrm{C} 31-\mathrm{O} 39)(50.68 \mathrm{kcal} / \mathrm{mol})$. The increasing order of maximum stabilization energy of transitions are $\pi(\mathrm{C} 3-\mathrm{C} 4)$ $\rightarrow \pi^{*}(\mathrm{C} 5-\mathrm{C} 6)(183.10 \mathrm{kcal} / \mathrm{mol})>\mathrm{LP}(2) \mathrm{O} 38 \rightarrow \pi^{*}(\mathrm{C} 31-\mathrm{O} 39)$ $(50.68 \mathrm{kcal} / \mathrm{mol})>\mathrm{LP}(2) \mathrm{O} 36 \rightarrow \pi^{*}(\mathrm{C} 20-\mathrm{O} 37)(50.35 \mathrm{kcal} / \mathrm{mol})$ $>$ LP(1) N35 $\rightarrow \pi^{*}(\mathrm{C} 3-\mathrm{C} 4)(46.51 \mathrm{kcal} / \mathrm{mol})$. The larger stabilization energy shows the hyperconjugative interactions between electron donor groups to acceptor groups in 4B2AEAB molecule.

Note: ${ }^{a} \mathrm{E}^{(2)}$ means energy of hyper-conjugative interaction (stabilization energy), ${ }^{\mathrm{b}} \mathrm{E}(\mathrm{j})$ - $\mathrm{E}(\mathrm{i})$ means energy difference between donor and acceptor I and $j$ NBO orbitals, ${ }^{\circ} F(i, j)$ is the Fock matrix element between $I$ and $j$ NBO orbitals.

## Local reactivity descriptors: Fukui function analysis

 (FFA): The chemical potential $(\mu)$, chemical hardness $(\eta)$, electronegativity $(\chi)$, electrophilicity $(\omega)$ and softness (S) are the global reactivity properties related to the chemical reactivity and where as local reactivity is related to selectivity postulation. So Fukui function analysis is the most important parameter of local reactivity. The Fukui function analysis for molecule defined the derivatives of electron density with respect to the change in number of electrons, keeping the location of nuclei unaltered [55,56]. Fukui function analysis gives us information about highly nucleophilic and electrophilic positions in a molecules or compounds. In employed appropriate way of calculating the Fukui function at atomic purpose is to use the condensed Fukui functions [57]. The Fukui function $\mathrm{f}_{\mathrm{k}}{ }^{+}(\mathrm{r})$ for nucleophilic attacks (r), $\mathrm{f}_{\mathrm{k}}^{-}(\mathrm{r})$ for electro-philic attacks (r) and $\mathrm{f}_{\mathrm{k}}{ }^{0}(\mathrm{r})$ for free radical attacks (r) can be mathematically expressed as:For nucleophilic attacks:

$$
\begin{equation*}
\mathrm{f}_{\mathrm{k}}^{+}(\mathrm{r})=\mathrm{q}_{\mathrm{k}}(\mathrm{r})(\mathrm{N}+1)-\mathrm{q}_{\mathrm{k}}(\mathrm{r})(\mathrm{N}) \tag{2}
\end{equation*}
$$

For electrophilic attacks:

$$
\begin{equation*}
\mathrm{f}_{\mathrm{k}}^{-}(\mathrm{r})=\mathrm{q}_{\mathrm{k}}(\mathrm{r})(\mathrm{N})-\mathrm{q}_{\mathrm{k}}(\mathrm{r})(\mathrm{N}-1) \tag{3}
\end{equation*}
$$

For free radical attacks:

$$
\begin{equation*}
\mathrm{f}_{\mathrm{k}}^{0}(\mathrm{r})=\mathrm{q}_{\mathrm{k}}(\mathrm{r})(\mathrm{N}+1)-\mathrm{q}_{\mathrm{k}}(\mathrm{r})(\mathrm{N}-1) \tag{4}
\end{equation*}
$$

In above equations, $\mathrm{q}_{\mathrm{k}}$ is the atomic charge (evaluated from Mulliken charges) at $\mathrm{k}^{\text {th }}$ atomic site in the cationic ( $\mathrm{N}-1$ ), anionic ( $\mathrm{N}+1$ ) or neutral molecule ( N ). Roy et al. [58] gives hypothesis of the "relative nucleophilicity" $\left(\mathrm{S}_{\mathrm{k}} / \mathrm{S}_{\mathrm{k}}{ }^{+}\right)$and the "relative electrophilicity" $\left(\mathrm{S}_{\mathrm{k}}{ }^{+} / \mathrm{S}_{\mathrm{k}}{ }^{-}\right)$descriptor for $\mathrm{k}^{\text {th }}$ atoms and this indicates preferred nucleophilic and electrophilic reactive positions in molecule for the study of the intermolecular reactivity in the chemical compounds. The nucleophilic and the elec-
trophilic local softness $\mathrm{s}_{\mathrm{k}}{ }^{-}$and $\mathrm{s}_{\mathrm{k}}{ }^{+}$[55] can be represented using mathematical equations as given below:

Nucleophilic local softness:

$$
\begin{equation*}
\mathrm{s}_{\mathrm{k}}^{-}=\mathrm{S} \mathrm{f}_{\mathrm{k}}^{-} \tag{5}
\end{equation*}
$$

Electrophilic local softness:

$$
\begin{equation*}
\mathrm{s}_{\mathrm{k}}^{+}=\mathrm{S} \mathrm{f}_{\mathrm{k}}^{+} \tag{6}
\end{equation*}
$$

In the above equation $S$ is the chemical softness and $f_{k}{ }^{-}$ and $\mathrm{f}_{\mathrm{k}}{ }^{+}$are the nucleophilic and electrophilic Fukui functions.

Chattaraj et al. [59] proposed the postulation of generalized philicity $\omega_{\mathrm{k}}{ }^{\mathrm{x}}$ ( $\mathrm{x}=-,+$ or 0 ) indices to identify the most reactive nucleophilic, electrophilic and radical positions in molecule and regioselectivity studies of chemical compounds. The local (or condensed) nucleophilicity $\omega_{k}{ }^{-}$and electrophilicity $\omega_{k}{ }^{+}$indices are related to the Parr global electrophilicity index $(\omega)$ and the corresponding Fukui functions by eqns. 7 and 8 are given below:

Local nucleophilicity:

$$
\begin{equation*}
\omega_{\mathrm{k}}^{-}=\omega \mathrm{f}_{\mathrm{k}}^{-} \tag{7}
\end{equation*}
$$

Local electrophilicity:

$$
\begin{equation*}
\omega_{\mathrm{k}}^{+}=\omega \mathrm{f}_{\mathrm{k}}^{+} \tag{8}
\end{equation*}
$$

where $\omega$ is the global electrophilicity index and $f_{k}{ }^{-}$and $f_{k}{ }^{+}$are the nucleophilic and electrophilic Fukui functions. According to the Parr and Yang stated that sites in chemical compound or reactant with largest values of Fukui function $\left(f_{k}\right)$ represent the high reactivity for corresponding attacks as compared to other atomic sites in the molecule or reactant. In the present study, the values of calculated Fukui functions ( $\mathrm{f}_{\mathrm{k}}$ ) based on the Mulliken atomic charges and calculated at DFT method with B3LYP and B3PW91 with $6-31+G(d, p)$ basis set in the water solvent using CPCM model, given in the Table-7a and 7 b .

From Table-7a and 7b, it is clear that the most preferred nucleophilic attack site in 4B2AEAB order at B3LYP and B3PW91 level are $6 \mathrm{C}>2 \mathrm{C}>11 \mathrm{C}>14 \mathrm{C}>15 \mathrm{C}>25 \mathrm{C}$ and 6 C $>2 \mathrm{C}>15 \mathrm{C}>25 \mathrm{C}>14 \mathrm{C}>11 \mathrm{C}$, respectively. The most preferred electrophilic attack site order in 4B2AEAB at B3LYP and B3PW91 are same $4 \mathrm{C}>5 \mathrm{C}>26 \mathrm{C}>12 \mathrm{O}>35 \mathrm{~N}$. The maximum value order of nucleophilic local softness ( $\mathrm{s}_{\mathrm{k}}{ }^{+}$) of 4B2AEAB at B3LYP and B3PW91 level are 6C $>2 \mathrm{C}>11 \mathrm{C}>$ $14 \mathrm{C}>15 \mathrm{C}>25 \mathrm{C}$ and $6 \mathrm{C}>2 \mathrm{C}>15 \mathrm{C}>25 \mathrm{C}>11 \mathrm{C}>14 \mathrm{C}>$ 12 O , respectively. The maximum value of electrophilic local softness ( $\mathrm{s}_{\mathrm{k}}^{-}$) order of 4B2AEAB at B3LYP and B3PW91 level are $4 \mathrm{C}>5 \mathrm{C}>20 \mathrm{C}>11 \mathrm{C}>1 \mathrm{C}>26 \mathrm{C}$ and $4 \mathrm{C}>5 \mathrm{C}>1 \mathrm{C}>$ $26 \mathrm{C}>20 \mathrm{C}$, respectively. The maximum value of local electrophilicity $\left(\omega^{+}\right)$order at B3LYP and B3PW91 level are 6C $>2 \mathrm{C}$ $>11 \mathrm{C}>14 \mathrm{C}>15 \mathrm{C}>25 \mathrm{C}$ and $6 \mathrm{C}>2 \mathrm{C}>15 \mathrm{C}>25 \mathrm{C}>11 \mathrm{C}>$ $14 \mathrm{C}>12 \mathrm{O}$, respectively. The maximum value orders of local nucleophilicity $\left(\omega_{k}^{-}\right)$of 4B2AEAB at B3LYP and B3PW91 level are $\mathrm{C} 4>\mathrm{C} 5>\mathrm{C} 1>\mathrm{C} 26>\mathrm{O} 12>\mathrm{N} 35>\mathrm{C} 20>\mathrm{C} 31>$ $\mathrm{C} 11>\mathrm{O} 36$ and $\mathrm{C} 4>\mathrm{C} 5>\mathrm{C} 1>\mathrm{C} 26>\mathrm{O} 12>\mathrm{N} 35>\mathrm{C} 3>\mathrm{C} 20$ $>\mathrm{C} 31>\mathrm{O} 36>\mathrm{C} 11$, respectively and these sites are more labile for electrophilic attacks. The increasing order of local electrophilicity at B3LYP and B3PW91 are $\mathrm{C} 6>\mathrm{C} 2>\mathrm{C} 11>$ $\mathrm{C} 15>\mathrm{C} 25>\mathrm{C} 21>\mathrm{O} 39$ and $\mathrm{C} 6>\mathrm{C} 2>\mathrm{C} 15>\mathrm{C} 25>\mathrm{C} 11>$ $\mathrm{C} 14>\mathrm{O} 12>\mathrm{C} 32>\mathrm{O} 39>\mathrm{N} 35$, respectively and these sites are more labile for nucleophilic attacks.

Electric moments [non-linear optical (NLO) properties calculations]: The theoretical calculation helps in easily understood the non-linear optical behaviour of NLO active materials. The intermolecular charge transfer and hyperpolarizability is the best chemical phenomenon play very important role to explain the participation of molecular structure or geometry in non-linear optical properties of NLO active molecule. Therefore, the molecular structure and NLO properties, both

properties are correlated by theoretical method may suggest the possibilities of design and synthesis of novel non-linear optical (NLO) materials.

The electron cloud of atoms or molecule has the ability to interact with an external electric field and hence increases the asymmetric electronic distribution in the ground state and excited states of atoms or molecule, which increase the optical non-linearity of the molecular system [60]. An organic compound with enhanced NLO property include of a D- $\pi$-A conjugation system substituted by an electron donor groups on one end and electron acceptor group on other end, forming a pushpull conjugated structure [61]. The first hyperpolarizability $(\beta)$ is a $3^{\text {rd }}$ rank tensor that can be explained by $3 \times 3 \times 3$ matrices. With the help of Kleinman symmetry the 27 components of the 3D-matrix reduced in to 10 components [62]. The components of $\beta$ are explained as the coefficients in the Taylor series expansion of energy in the external electric field. When the external electric field is homogeneous and weak, this expansion becomes as:

$$
\begin{equation*}
\mathrm{E}=\mathrm{E}^{0}-\mu \mathrm{F}-1 / 2 \alpha \mathrm{~F}^{2}-1 / 6 \beta \mathrm{~F}^{3}-1 / 24 \gamma \mathrm{~F}^{4} \tag{9}
\end{equation*}
$$

where $E$ is the external electric field, $\mathrm{E}^{0}$ is the energy of unperturbed molecule, F is the field at the origin, $\mu$ is the dipole moment, $\alpha$ is the polarizability, $\beta$ and $\gamma$ is the first hyperpolarizability and the second hyperpolarizability, respectively. The second hyperpolarizability is known as third order non-linear optical (NLO) coefficient and defined by forth rank tensor. The mathematical equations of electronic moments like total static dipole moment $(\mu)$, the average polarizability $(\alpha)$, anisotropy of polarizability and first hyperpolarizability ( $\beta_{\text {tot }}$ ) of the title molecule and its derivatives are defined by the $x, y, z$ components given as:

$$
\begin{gather*}
\mu=\left(\mu_{\mathrm{x}}^{2}+\mu_{y}^{2}+\mu_{z}^{2}\right)^{1 / 2}  \tag{10}\\
\alpha=1 / 3\left(\alpha_{x x}+\alpha_{y y}+\alpha_{z z}\right)  \tag{11}\\
\Delta \alpha=\sqrt{ }\left[\left(\alpha_{x x}-\alpha_{y y}\right)^{2}+\left(\alpha_{x x}-\alpha_{z z}\right)^{2}+\left(\alpha_{y y}-\alpha_{z z}\right)^{2}+\right. \\
\left.6\left(\alpha_{x x}^{2}+\alpha_{y y}^{2}+\alpha_{z z}^{2}\right)\right] / 2  \tag{12}\\
\beta_{\text {tot }}=\left[\left(\beta_{\mathrm{xxx}}+\beta_{\mathrm{xyy}}+\beta_{\mathrm{xzz}}\right)^{2}+\left(\beta_{\mathrm{yyy}}+\beta_{\mathrm{yxx}}+\beta_{\mathrm{yzz}}\right)^{2}+\right. \\
\left.\left(\beta_{z z z}+\beta_{z x x}+\beta_{z y y}\right)^{1 / 2}\right]^{1 / 2}  \tag{13}\\
\beta_{\mathrm{tot}}=\left[\beta^{2}{ }_{\mathrm{x}}+\beta^{2}+\beta_{\mathrm{z}}^{2}\right]^{1 / 2} \tag{14}
\end{gather*}
$$

where $\beta^{2}, \beta_{y}^{2}, \beta_{z}^{2}$ are the components of the second order polarizability tensor and can be calculated by following equations:

$$
\begin{equation*}
\beta_{\mathrm{i}}=\beta_{\mathrm{iii}}+\frac{1}{3} \sum_{\mathrm{i} \neq \mathrm{j}}\left[\left(\beta_{\mathrm{ijj}}+\beta_{\mathrm{jij}}+\beta_{\mathrm{iji}}\right)\right], \mathrm{i}, \mathrm{j}=\mathrm{x}, \mathrm{y}, \mathrm{z} \tag{15}
\end{equation*}
$$

and average value of third-order hyperpolarizability is given by following equation:

$$
\begin{equation*}
\langle\gamma\rangle=\frac{1}{5}\left[\gamma_{\mathrm{xxxx}}+\gamma_{\mathrm{yyyy}}+\gamma_{z z z z}+2\left(\gamma_{\mathrm{xxyy}}+\gamma_{\mathrm{xxzz}}+\gamma_{\mathrm{yyzz}}\right)\right] \tag{16}
\end{equation*}
$$

To gain insight into the fundamental non-linear optical (NLO) properties like dipole moment ( $\mu$ ), polarizability ( $\alpha$ ), anisotropy of polarizability $(\Delta \alpha)$, first-order hyperpolarizability $\left(\beta_{\text {tot }}\right)$ and second-order hyperpolarizability $(<\gamma>)$ and NLO response of novel organic NLO materials like 4B2AEAB, 4B2AEAB4NP and 4B2AEABTU compounds were calculated using DFT method with B3LYP and B3PW91 functional with $6-31+G(d, p)$ basis set in water solvent phase using CPCM model and presented in Table-8a. All the values of polarizability $(\alpha)$, hyperpolarizability $(\beta)$ and the Gaussian output file $(\gamma)$ are obtained in atomic units (a.u.), the calculated values have been converted into e.s.u. unit system ( $\alpha$ : 1 a.u. $=0.1482$
$\times 10^{-24}$ esu; $\beta: 1$ a.u. $=8.6393 \times 10^{-34}$ esu; $\gamma: 1$ a.u. $=5.036 \times$ $10^{-40} \mathrm{esu}$ ). The calculated values of electronic moments are dipole moment ( $\mu$ ) 8.1514 and 8.0302 Debye, polarizability ( $\alpha$ ) $42.929 \times 10^{-24}$ and $42.289 \times 10^{-24} \mathrm{esu}$, anisotropy of polarizability $(\Delta \alpha) 17.730 \times 10^{-24}$ and $17.910 \times 10^{-24}$ esu, first-order hyperpolarizability $\left(\beta_{\text {tot }}\right) 2.80538 \times 10^{-30}$ and $2.12040 \times 10^{-30}$ esu and second-order hyperpolarizability $<\gamma>-2.05599 \times 10^{-36}$ esu and $-2.00746 \times 10^{-36} \mathrm{esu}$ ) for title molecule (4B2AEAB) at B3LYP and B3PW91 with 6-31+ (d, p) basis set in water solvent, respectively.

The calculated dipole moment, polarizability, anisotropy of polarizability, first-order hyperpolarizability and secondorder hyperpolarizability of 4B2AEAB4NP and 4B2AEABTU hydrogen bonded complex at B3LYP/6-31+G(d,p) basis set in water solvent using CPCM model values are 18.9971 Debye, $65.0212186 \times 10^{-24}$ esu, $39.1170235 \times 10^{-24}$ esu, $12.73333 \times$ $10^{-30}$ esu, $-8.02090806 \times 10^{-36}$ esu and 17.2703 Debye, 54.3673182 $\times 10^{-24} \mathrm{esu}, 29.6642781 \times 10^{-24} \mathrm{esu}, 12.00412 \times 10^{-30} \mathrm{esu}$, $-5.52491331 \times 10^{-36}$ esu, respectively.

Further, the calculated values of 4B2AEAB and its derivatives were compared to the few known organic non-linear optical materials given in the literature such as 4-dimethyl amino benzaldehyde 4-nitophenol complex (4DMAB4NP) [32], 1,2-dichloro-4-nitrobenzene (DCNB) [63], 3-aminopyridine-4nitrophenol (3AP4NP) [64], 8-hydroxyquinolinium-3,5-dinitrobenzoate (HOQDNB) [65], morpholinium-2-chloro-4-nitrobenzoate (M2C4N) [66], 2-amino-4-picolinium-nitrophenolate nitrophenol (2A4PNN) [67], $N$-succinopyridine (NSP) [68], piperidinium $p$-hydroxybenzoate (PDPHB) [69], pyrrolidinium $p$-hydroxybenzoate (PYPHB) [70] and are listed in Table-8b.

The second-order hyperpolarizability value of 4B2AEAB and its derivatives (4B2AEAB4NP and 4B2AEABTU) depends on the numbers of factors, which include the extent of electronic conjugation, the nature of substituent and the dimensionality of the molecules. In these compounds, the presence of -CHO , $-\mathrm{N}\left(\mathrm{C}_{2} \mathrm{H}_{4}-\mathrm{O}-\mathrm{CO}-\mathrm{CH}_{3}\right)_{2},-\mathrm{OH}$ group, $-\mathrm{NO}_{2}$ are attached to the benzene rings; $-\mathrm{NH}_{2}$ group and $\mathrm{C}=\mathrm{S}$ group found in urea acted as donor- $\pi$-acceptor system, which is responsible for the delo-

calization of electron and conjugation within the molecule. This electron delocalization in tern induces non-linear optical (NLO) behaviour in 4B2AEAB), 4B2AEAB4NP and 4B2AEABTU compounds.

Frontier molecular orbital (FMOs) analysis: The transition of electron from the ground state to the first excited state is mainly explained by the excitation from HOMO (highest occupied molecular orbital) to the LUMO (lowest unoccupied molecular orbital) FMOs (HOMO and LUMO) are the main orbitals having most important contribution in stability [71] and their distinct properties such as energy gap and electron density are important for researchers to study the physicochemical properties of the molecule [68]. The HOMO and LUMO transitions can be easily understood from the visualization of orbital charge distribution over the 4B2AEAB and its derivatives. The HOMO and LUMO is the represented by electron donor an electron acceptor, respectively. The energies of HOMO, LUMO and energy gap ( $\Delta \mathrm{E}_{\text {gap }}$ ) of 4B2AEAB, 4 B 2 AEAB 4 NP and 4B2AEABTU compounds are shown in Fig. 5. In order to find out the information about chemical reactivity of 4B2AEAB and its derivatives, the global reactivity descriptors such as $\mathrm{E}_{\text {номо }}, \mathrm{E}_{\text {LUмо, }}$, energy gap $\left(\Delta \mathrm{E}_{\mathrm{L}-\mathrm{H}}\right)$, chemical hardness $(\eta)$, electronegativity $(\chi)$, chemical potential $(\mu)$, global softness, electrophilicity index $(\omega)$ and maximum amount of electronic charge that an electrophile may accept $\left(\mathrm{Q}_{\max }\right)$ have
been calculated by using HOMO and LUMO energies and calculated at DFT/B3LYP \& B3PW91/6-31+G(d,p) in water solvent using CPCM model. The mathematical equations (1725) of global reactivity descriptors [72-75] and results are shown in Table-9.

From Table-9, the frontier orbital gap of 4B2AEAB at B3LYP and B3PW91 level are 4.106 eV and 4.135 eV , respectively. The lowest energy gap found in 4B2AEAB4NP compound shows a high chemical reactivity and low kinetic stability and termed as soft molecule. The lowest energy gap order of 4B2AEAB4NP, 4B2AEABTU and 4B2AEAB at B3LYP level are $3.229>3.980>4.106$, respectively. The value of electrophilicity index of 4B2AEAB and its H -bonded derivatives (4B2AEAB4NP, 4B2AEABTU) at B3LYP level of theory are 3.698 eV and $6.2153 \mathrm{eV}, 4.1391 \mathrm{eV}$, respectively and the energy lowering due to maximal flow of electrons found between donor and acceptor of 4B2AEAB4NP molecule. The value of $\mathrm{Q}_{\max }$ of $4 \mathrm{~B} 2 \mathrm{AEAB}, 4 \mathrm{~B} 2 \mathrm{AEAB} 4 \mathrm{NP}$ and 4 B 2 AEABTU at B3LYP level are 1.898 and $2.7743,2.0394$, respectively, the 4B2AEAB4NP compound shows the maximum amount of electronic charge transfer between donor and acceptor.

In addition, as a result, global reactivity descriptors, chemical potential, hardness, global softness and electrophilicity index showed that the title molecule (4B2AEAB) and its derivatives is showing high chemical reactivity and low kinetic stability

Fig. 5. Molecular orbitals and energies for the HOMO and LUMO of 4B2AEAB (A), 4B2AEAB4NP (B) and 4B2AEABTU (C) compounds in water solvent calculate at DFT/B3LYP/6-31+G (d,p) method
(a soft molecule) and displayed higher intermolecular charge transfer (ICT) [76].

Density of states (DOS spectrum) analysis: The molecular orbitals (HOMO and LUMO) contribution of different constituting elements present in the total system for 4B2AEAB and its derivatives, which is provided by density of state (DOS). The density of state spectrum is calculated by using GaussSum software [77] and the spectrum of 4B2AEA and its derivatives are shown in Fig. 6. From the DOS plot, it is clear that the DOS plot shows population analysis per orbitals and shows the simple view of makeup of the HOMO and LUMO in certain energy range.

Electrostatic potential (ESP), total electron density (ED) and 2D contour map: The 3D plot of the electrostatic potential (ESP), total electron density (ED) plot and 2D contour map plot for 4B2AEAB and its derivatives were visualized through Gauss View 5.0 program is illustrated in Fig. 7. The electrostatic potential (ESP) map is the important tool to define the charged region (electrophilic and nucleophilic sites) in the molecules or compounds in term of colour coding [78]. In present compounds, the $\mathrm{O}-\mathrm{H}-\mathrm{O}$ hydrogen bonding play an
important role in explaining the stability of the molecules. The colour code of electrostatic potential (ESP) map for 4B2AEAB, 4B2AEAB4NP and 4B2AEABTU compounds were taken from -0.0 deepest red (very negative), orange (negative), yellow (slightly negative), green (neutral), turquoise (slightly positive), light blue (positive) to +0.0 dark blue (very positive) and have 0.02 iso-value and 0.004 a.u. energy values for all the ESP of 4B2AEAB and its derivatives at DFT/B3LYP/6-31+G(d,p) level in water solvent. The oxygen atom of aldehyde group, nitro group and acetyl group of all derivatives possess negative charges and were attributed to electrophilic behaviour of the 4B2AEAB and its derivatives. Likewise, the H -atoms in the both regions surrounded by nucleophilic reactivity in all the molecule of present work. The flow of electron density in 4B2AEAB and its derivatives were represented by lines in terms of colour code.

The electrostatic potential (ESP) contour map of the 4B2AEAB and its derivatives are illustrated in Fig. 7. The red colour line represent the presence of negative charges whereas blue lines represents the positive region and green line represent the neutral region in the 4 B 2 AEAB and its derivatives.

Fig. 6. Density of state (DOS) spectra of 4B2AEAB (A), 4B2AEAB4NP (B) and 4B2AEABTU (C) compounds

Fig. 7. ESP, electron density (ED) and 2D contour map for 4B2AEAB (1, $2 \& 3$ ), 4B2AEAB4NP (2A, 2B \& 2C) and 4B2AEABTU (3A, 3B \& 3C) compounds

Mulliken atomic charges (MPA) and thermodynamic properties: The Mulliken atomic charges of 4B2AEAB using B3LYP and B3PW91 and its derivatives (viz. 4B2AEAB4NP and 4B2AEABTU) were analyzed by using optimized structure at DFT/B3LYP or B3PW91/6-31+G(d,p) basis set in water solvent and are illustrated in Fig. 8.

Mulliken atomic charges of 4B2AEAB, 4B2AEAB4NP and 4B2AEABTU compounds were varied from -1.060823/ -1.350507 to $+0.546283 /+0.566822$ (at B3LYP \& B3PW91 level), -0.667764 to +0.800482 (at B3LYP level) and -0.889052 to +0.553020 , respectively. The atoms $1 \mathrm{C}, 3 \mathrm{C}, 11 \mathrm{C}, 13 \mathrm{H}, 15 \mathrm{C}$, 20 C and 31 C in 4B2AEAB were positively charged and the remaining $\mathrm{C}, \mathrm{N}, \mathrm{O}$ atoms were negatively charged, whereas in 4B2AEAB4NP compound, the atoms $41 \mathrm{C}, 43 \mathrm{C}, 44 \mathrm{C}, 55 \mathrm{H}$ and $1 \mathrm{C}, 3 \mathrm{C}, 11 \mathrm{C}, 13 \mathrm{H}, 15 \mathrm{C}, 20 \mathrm{C}$ and 31 C were positively charged in nitro phenol and aldehyde moiety, respectively and remaining atoms were negatively charged. In 4B2AEABTU, $41 \mathrm{C}, 43 \mathrm{H}, 44 \mathrm{H}, 46 \mathrm{H}, 47 \mathrm{H}$ were positively charged, while the $42 \mathrm{~N}, 45 \mathrm{~N}, 48 \mathrm{~S}$ atoms of urea moiety were negatively charged.

The sum of mulliken atomic charges of the 4B2AEAB and its derivatives were estimated to be zero which confirmed the neutral charge. The results of mulliken atomic charges of the optimized structure of 4B2AEAB and its derivatives are shown in Table-10. Further, on the basis of vibrational analysis, the statistical thermodynamic functions such as entropy (S), enthalpy (H) and heat capacity $\left(\mathrm{C}_{\mathrm{v}}\right)$ changes of 4B2AEAB, 4B2AEAB4NP complex and 4B2AEABTU compounds were obtained from the theoretical harmonic frequencies and are calculated by computing the following equations implemented in Gaussian program $[79,80]$. The thermal energy (E) (internal) could be calculated using the equation given as:

$$
\begin{equation*}
\mathrm{E}=\mathrm{Nk}_{\mathrm{B}} \mathrm{~T}^{2}\left(\frac{\partial \ln \mathrm{q}}{\partial \mathrm{~T}}\right)_{\mathrm{v}} \tag{26}
\end{equation*}
$$

The heat capacity $\left(\mathrm{C}_{\mathrm{v}}\right)$ could be calculated using following equation given as:

$$
\begin{equation*}
\mathrm{C}_{\mathrm{v}}=\left(\frac{\partial \mathrm{E}}{\partial \mathrm{~T}}\right)_{\mathrm{N}, \mathrm{~V}} \tag{27}
\end{equation*}
$$

Similarly, entropy (s) could be calculated using the following equation by using vibrational ( $\mathrm{q}_{\mathrm{v}}$ ), translational ( $\mathrm{q}_{\mathrm{t}}$ ), rotational $\left(\mathrm{q}_{\mathrm{r}}\right)$ and electronic $\left(\mathrm{q}_{\mathrm{e}}\right)$ partition functions given as:

$$
\begin{equation*}
\mathrm{S}=\mathrm{Nk}_{\mathrm{B}}+\mathrm{Nk}_{\mathrm{B}} \ln \left(\frac{\mathrm{q}(\mathrm{~V}, \mathrm{~T})}{\mathrm{N}}\right)+\mathrm{Nk}_{\mathrm{B}} \mathrm{~T}\left(\frac{\partial \ln \mathrm{q}}{\partial \mathrm{~T}}\right)_{\mathrm{v}} \tag{28}
\end{equation*}
$$

The thermodynamic properties like thermal energy ( E ), heat capacity $\left(\mathrm{C}_{\mathrm{v}}\right)$ and entropy $(\mathrm{S})$ of 4B2AEAB, 4B2AEAB4NP and 4 B 2 AEABTU compounds were calculated at constant pressure 1 atm and temperature 298.15 Kelvin at DFT/B3LYP/ $6-31+G(d, p)$ level of theory in water solvent using CPCM model and results are given in Table-11a. The order of highest value of $\mathrm{E}, \mathrm{C}_{\mathrm{v}}, \mathrm{S}, \mathrm{ZPVE}$ are $4 \mathrm{~B} 2 \mathrm{AEAB} 4 \mathrm{NP}>4 \mathrm{~B} 2 \mathrm{AEABTU}>$ 4B2AEAB, respectively.

On the basis of vibrational analysis and statistical thermodynamics, the thermodynamics functions such as heat capacity $(\mathrm{Cv})$, enthalpy (E) and entropy (S) changes were calculated from 100 K to 1000 K at DFT/B3LYP/6-31+G(d,p) level of theory in water solvent using CPCM model for the title molecule (4B2AEAB) were obtained from the theoretical calculation of harmonic wavenumbers $\left(\mathrm{cm}^{-1}\right)$ and are presented in Table-11b. From Table-11b, it is clearly observed that these thermodynamic functions (enthalpy, heat capacity, entropy) are increasing with temperature in the range $100-1000 \mathrm{~K}$ and the corresponding fitting factor $\left(\mathrm{R}^{2}\right)$ for enthalpy $(\mathrm{E})$, heat capacity $(\mathrm{Cv})$ and entropy $(\mathrm{S})$ are $0.971,0.962$ and 0.995 , respectively. The correlation between thermodynamic properties and temperature are illustrated in Figs. 9 and 10 and the graph equations are as follows:

> For enthalpy $(H): y=0.114 x+182.3\left(R^{2}=0.971\right)$ and coefficient $(r)=0.9855$

For heat capacity $\left(C_{v}\right): y=0.154 x+26.13\left(R^{2}=0.962\right)$ and coefficient $(\mathrm{r})=0.9811$

$$
\begin{aligned}
& \text { For entropy }(S): y=0.223 x+72.59\left(R^{2}=0.995\right) \\

of drug-likeness properties of rationally designed 4B2AEAB, 4B2AEAB4NP and 4B2AEABTU compounds. The values of physico-chemical properties of these compounds could be obeying the Lipinski rule of five (RO5) without any violation, indicating that all the studies compounds could be orally active drugs in human because Lipinski RO5 [82] stated that the any molecule will likely to be active if (i) MW $\leq 500$, (ii) $\log \mathrm{P} \leq$ 5 , (iii) number of hydrogen bond donor (HBD) $\leq 5$ and (iv) no. HBA $\leq 10$. It is clear from Table-12a, that all these compounds exhibited a good percent absorption (\%ABS) ranging from $66.63 \%$ to $83.84 \%$ and were found to be non-toxic in nature. A parameter used to calculate aqueous solubility is $\log \mathrm{S}$ ( S in $\mathrm{mol} / \mathrm{L}$ ). The solubility values of these compounds ranged from $-2.42 \mathrm{~mol} / \mathrm{L}$ to $-5.32 \mathrm{~mol} / \mathrm{L}$. The topological polar surface area (TPSA) of these compounds have value below $160 \AA$, the entire molecule confirm that absorption of drug. The TPSA used to calculate the \%ABS is equal to [109-(0.345 $\times$ TPSA)] [83]. All the physico-chemical properties of these compounds were calculated from Molinspiration free online server [84] and SwissADME server [85].

The bioactivity such as GPCR (G-protein coupled receptor) ligand, ion channel modulator, kinase inhibitor, nuclear receptor ligand, protease and enzyme inhibitor properties of the 4B2AEAB and derivatives were calculated from Molinspiration free online server [84] and results of bioactivity score illustrated in Table-12a and bioactivity score graph is shown in Fig. 11. The bioactivity are measured by bioactivity score categorized under three deferent conditions (i) if bioactivity score more than 0.00 , having considerable bioactivity, (ii) if bioactivity score 0.5 to 0.00 , having moderate biological activity, (iii) if bioactivity score is less than -0.50 , having inactivity [86]. The results of the present study are fulfilled that 4B2AEAB and its derivatives are biologically active and have physiological effects.

The absorption, distribution, metabolism, excretion and toxicity (ADMET) properties of all the three compounds are

Fig. 11. Bioactivity score graphics of 4B2AEAB, 4B2AEAB4NP and 4B2AEABTU compounds
illustrated in Table-12b and 12c. The entire properties like ADMET are predicted from SwissADME server [85] and preADMET server [87].

From Table-12b and 12c, it is clear that the gastrointestinal absorption (GI) of 4B2AEAB is high while 4B2AEA4NP and B2AEABTU is low because $30 \% \mathrm{ABS}$ standard value for gastrointestinal absorption. The skin permeability ( $\log \mathrm{K}_{\mathrm{P}}$ in $\mathrm{cm} / \mathrm{s}$ ) high for 4B2AEAB, 4B2AEAB4NP and 4B2AEABTU were $-7.17,-7.03$ and $-8.23 \mathrm{~cm} / \mathrm{s}$, which shows a high permeability in the skin because standard value for skin permeability log $K_{P}$ is $-2.5 \mathrm{~cm} / \mathrm{s}$. The 4B2AEAB and its derivatives are not blood brain barrier (BBB) permeant and from Fig. 12, a yellow coloured point shown in "boiled egg" show the molecule-1 (4B2AEAB) is not passively transferred through the blood brain barrier (BBB).

In present study, compound 4B2AEAB in Fig. 12 pointed in the "boiled egg" white is molecule predicted to be passively absorbed by the gastrointestinal tract but compound-2 (4B2AEAB4NP) and compound-3 (4B2AEABTU) are not permeate by gastrointestinal tract. Where compound-1 (4B2AEAB) and compound-3 (4B2AEABTU) (shown in red dot in "boiled egg", Fig. 12) are not effluated from the central nervous system (CNS) by the P-glycoprotein but in case of

Fig. 12. Test and illustrative use of "Boiled Egg": 4B2AEAB (molecule-1) represented by red circle (well absorbed in human intestine and not effluated from CNS by P-GPs) and 4B2AEAB4NP (molecule-2) represented by blue colour (positively effluated from CNS by PGPs) and 4B2AEABTU (molecule-2) not effluated from CNS by P-glycoprotein
compound-2 (4B2AEAB4NP) are shown in blue dot in the "boiled egg" is effluated from CNS by the P-glycoprotein. The caco- 2 cells permeability are making out from human colon adenocarcinoma and posses multiple drug transport pathway
through the intestinal epithelium at pH 7.4 [88]. Here, the $4 B 2 A E A B, 4 B 2 A E A B 4 N P$ and $4 B 2 A E A B T U$ compounds are middle permeability. Also, we discussed about the cytochrome P450 (CYP) super family of enzymes key player in oxidize steroids, fatty acids and xenobiotics and are important for the clearance of various compounds, as well as for hormone synthesis and drugs elimination through metabolic biotransformation [89]. The cytochrome P450 super family contains five major isoforms (CYP1A2, CYP2C19, CYP2C9, CYP2D6 and CYP3A4). Here 4B2AEAB only inhibits the CYP1A2 isoenzymes and shows a major cause of pharmacokinetics related drug-drug interactions leading to toxic or other unwanted adverse effects due to lower clearance and accumulation of the drug or its metabolites and the 4B2AEAB compound not inhibited the remaining isoenzymes of super family. The 4B2AEAB4NP and 4B2AEABTU compounds are easily eliminated and cleared through metabolic biotransformation due to both the complex are not inhibited the any isoenzymes of super family of cytochrome P450. The prediction of human intestinal absorption (HIA) is very important for discovery of potential drug candidate. The predicted data of HIA is the sum of absorption and bioavailability evaluated from ratio of excretion or cumulative excretion in urine, bile and feces at pH 7.4 [90]. In the present study, the 4B2AEAB and its derivatives are well absorbed comp-
ounds because the values are $96.5216,84.5418$ and $85.1513 \%$ at pH 7.4 , found in acceptable range $(0-20 \%$ poorly absorbed compounds, $20-70 \%$ moderately absorbed compounds, $70-100 \%$ well absorbed compounds) [91]. The phenomena of plasma protein bonding with any drug influence the drug action but also its deposition and efficacy. Generally, unbound drug is available for diffusion or transport across the cell membrane and also for interaction with physiological target. In the present study, 4B2AEAB compound easily diffuse or transport the cell membrane and also for interaction with target. The value of PPB percentage for 4B2AEAB compound is $70.3557 \%$ (chemical weakly bound have value less than $90 \%$ ), while the other compounds (4B2AEAB4NP and 4B2AEABTU) were strongly bounded with PPB because both compound have plasma protein binding value of $92.1583 \%$ and $96.6583 \%$ (reference value: more than $90 \%$ the molecule bound strongly with PPB), respectively.

The toxicity profile of 4B2AEAB and its derivatives are presented in the Table-12c. From Table-12c, it is clear that 4B2AEAB and its derivatives are mutagen by Ames test. The 4B2AEAB and its derivatives results shows negative, so that the entire molecule produce carcinogenicity in mice and rat. The preADMET predict toxicity to TA100 and TA1535 strain (+S9 with rat liver and -S9 strain without rat liver) which are often used in Ames test. All the result of Ames test for entire compounds in present study is in negative (no change of population versus blank plate). In the case of 4B2AEAB4NP and 4B2AEABTU compounds show positive Ames test for TA100 (+S9 strain rat liver) strain (means change of population, more than double of blank plate's change). The hERG $\mathrm{K}^{+}$channel is responsible for electrical activity of heart that coordinates the heart's beating; appear to be the molecular target responsible for the cardiac toxicity of wide range of therapeutic drugs [92]. In the present study, the entire molecule shows medium risk for hERG K ${ }^{+}$channel. The in silico study provides the cardiac toxicity of drugs in the early stage of drug discovery. The results of this in silico bioactivity score prediction, physico-chemical study and ADMET prediction analysis suggest that the computational designed 4B2AEAB, 4B2AEAB4NP and 4B2AEABTU follow the criteria for orally active drugs and thus represent a pharmacological active framework that should be considered on progressing further potential hits [93].

## Conclusion

In conclusion, a novel 4-[bis[2-(acetyloxy)ethyl]amino]benzaldehyde (4B2AEAB), hydrogen bonded structure and D- $\pi$-A charge transfer type organic complex of 4-[bis[2-(acety-loxy)ethyl]amino]-benzaldehyde-4-nitrophenol (4B2AEAB4NP) and 4-[bis[2-(acetyloxy)ethyl]amino]benzaldehyde-thiourea (4B2AEABTU) complex have been rationally designed and structure was optimized by using DFT/B3LYP and DFT/B3PW91 method with $6-31+\mathrm{G}(\mathrm{d}, \mathrm{p})$ basis set in water solvent using CPCM model. The calculated vibrational wavenumbers $\left(\mathrm{cm}^{-1}\right)$ and spectra agreed with the experimental FT-IR wavenumbers. The global minimum energy between the different functional shows the difference in optimization between the same and the different solvents. The magnetic properties of the 4B2AEAB were observed and calculated chemical shift of ${ }^{1} \mathrm{H} \&{ }^{13} \mathrm{C}$ NMR
were compared with experimental chemical shift. The net charge distributions on the 4B2AEAB moleclue were calculated by Mulliken population analysis. The electrostatic potential (ESP) map, total electron density (ED) and 2D contour map showed that the negative potential sites (electrophilic attacks) are on the electronegative atoms N and O atoms (intramolecular H bond sites) as well as the positive potential (nucleophilic attacks) sites are around the intermolecular bond sites and H atoms of the 4B2AEAB, 4B2AEAB4NP and 4B2AEABTU complexes. The ESP plots revealed the possible reaction sites of 4B2AEAB and its derivatives. The local chemical reactivity descriptors (Fukui function analysis, local softness and local philicity analysis) were calculated for the 4B2AEAB. The natural bond orbital (NBO) analysis revealed that the delocalization and hyperconjugation interactions, intra molecular charge transfer and stabilization energies of the title molecule. The theoretical UV-visible spectral analysis of 4B2AEAB and its derivatives in gas phase and solvent phase has also provided insight into the $\lambda_{\text {max }}$, excitation energy oscillator strength and molecular orbital assignment and predicted mainly the $\pi \rightarrow \pi^{*}$ type transitions which are intramolecular charge transfer type. The non-linear optical (NLO) behaviour of 4B2AEAB and Hbonded and D- $\pi$-A type 4B2AEAB4NP and 4B2AEABTU complex were investigated by the analysis of dipole moment $(\mu)$, polarizability $(\alpha)$, anisotropy of polarizability $(\Delta \alpha)$, firstorder hyperpolarizability $(\beta)$ and second-order hyperpolarizability $<\gamma>$ using the DFT/B3LYP/6-31+G(d, p) method in water solvent using CPCM model. The first-order hyperpolarizability $(\beta)$ and second-order hyperpolarizability $(\gamma)$ value of 4B2AEAB, 4B2AEAB4NP complex and 4B2AEABTU complex were $2.80538 \times 10^{-30} \mathrm{esu}, 12.73333 \times 10^{-30} \mathrm{esu}, 12.00412 \times 10^{-30}$ esu and $-2.05599 \times 10^{-36} \mathrm{esu},-8.02090806 \times 10^{-36} \mathrm{esu},-5.52491331$ $\times 10^{-36}$ esu, respectively, which is almost more time higher than urea and show good agreement with organic NLO active materials. The comparative analysis between temperature and statistical thermodynamic properties are also obtained for the 4B2AEAB. It was seen that the enthalpy, heat capacity and entropy increase with the increasing temperature ( 100 K to 1000 K ) owing to the intensities of the molecular vibrations increase with increasing temperature ( 100 to 1000 K ). The in silico bioactivity score prediction, pharmacokinetic analysis and ADMET parameter analysis for the title molecule and its derivatives has been shown that these compounds have good oral drug like properties and all these compounds not have Lipinski rule of five violations and could developed as good oral drug candidates. Finally, from this study, it is clear that 4B2AEAB and its derivatives (4B2AEAB4NP and 4B2AEABTU) have superior non-linear optical (NLO) properties than urea and some organic NLO material and also have pharmaceutical importance. Thus, it can be used in photonic communication devices and used as oral drug for future prospective in the field of pharmaceutical industry.

## ACKNOWLEDGEMENTS

The authors are thankful to the Department of Chemistry, University of Lucknow, Lucknow, India, for providing facilities to purse this research work.

Vol. 32, No. 11 (2020) Studies of Novel Organic Molecular Complex of 4-[Bis[2-(acetyloxy)ethyl]amino]benzaldehyde Derivatives 2819

## CONFLICT OF INTEREST

The authors declare that there is no conflict of interests regarding the publication of this article.
