Three ( $1 \mathrm{R}, 5 \mathrm{R}$ )-(-)3-arylideneopinones ( $\mathbf{2 a}, \mathbf{2 b}$ and $\mathbf{2 c}$ ) were first synthesized and characterized by IR, MS, NMR, elemental analysis and single-crystal X-ray diffraction method. The structure indicates that the compound 2a belongs to orthorhombic, space group $\mathrm{P} 2_{1} 2_{1} 2_{1}$ with $\mathrm{a}=1.0378(5) \mathrm{nm}, \mathrm{b}=1.1156(6) \mathrm{nm}, \mathrm{c}=1.2775(7) \mathrm{nm}, \beta=90^{\circ} . \mathrm{V}=1.4791(13) \mathrm{nm}^{3}, \mathrm{Z}=4, \rho=1.223 \mathrm{~g} \mathrm{~cm}^{-3}, \mu=0.083 \mathrm{~mm}^{-1}, \mathrm{~F}(000)=$ 584 and final $\mathrm{R}_{1}=0.0327, \mathrm{wR} 2=0.0876$. The compound $\mathbf{2 b}$ belongs to trigonal, space group $\mathrm{P} 3_{2}$ with $\mathrm{a}=0.93024(12) \mathrm{nm}, \mathrm{b}=0.93024$ (12) $\mathrm{nm}, \mathrm{c}=1.3215(4) \mathrm{nm}, \beta=90.0^{\circ} . \mathrm{V}=0.9903(3) \mathrm{nm}^{3}, \mathrm{Z}=3, \rho=1.219 \mathrm{~g} \mathrm{~cm}^{-3}, \mu=0.079 \mathrm{~mm}^{-1}, \mathrm{~F}(000)=390$ and final $\mathrm{R}_{1}=0.0350$, wR2 $=$ 0.0912. The compound 2 c belongs to monoclinic, space group $\mathrm{P}_{1}$ with $\mathrm{a}=1.20252(15) \mathrm{nm}, \mathrm{b}=0.99228(12) \mathrm{nm}, \mathrm{c}=2.3905(3) \mathrm{nm}, \beta=$ $92.769(2)^{\circ} . \mathrm{V}=2.8491(6) \mathrm{nm}^{3}, \mathrm{Z}=8, \rho=1.216 \mathrm{~g} \mathrm{~cm}^{-3}, \mu=0.254 \mathrm{~mm}^{-1}, \mathrm{~F}(000)=1104$ and final $\mathrm{R}_{1}=0.0440, \mathrm{wR} 2=0.1069$.

Key Words: (1S,5S)-(-)- $\beta$-pinene, (1R,5S)-(+)-nopinone, (1R,5R)-(-)-3-arylideneno-pinones, Crystal structure, Synthesis.

## INTRODUCTION

It is a well-known fact that an over exposure to solar ultraviolet radiation is harmful to human health, the major acute effects on normal human skin comprise sunburn cells, tanning, premature skin aging and an increased risk for skin cancers ${ }^{1-3}$. The steady increase in the incidence of melanoma, non-melanoma cutaneous neoplasia and preneoplasic disorders has contributed to the demand for more effective protection from the sun ${ }^{4-6}$.

Terpenoid derivatives, such as benzylidene camphor, $p$ methylbenzylidene camphor, benzylidene camphor sulfonic acid, are widely used as UV filters in cosmetics because of their stable storage, no irritation to skin, no photosensitization, low toxicity, good stability and chemical inertness and low absorption to skin ${ }^{7,8}$. However, natural camphor is expensive and the synthesized camphor exist several disadvantages including a long process of synthesis routes and severe environmental pollution. The crystal structure of such compounds are interesting and have seldom been reported. Herein, we report the synthesis and structural characterization of a chiral (1R,5R)-3-arylidenopinones (2a-2c) which had good ultraviolet absorption characteristics by using a low cost and abundant renewable resource $\beta$-pinene as the raw material.

## EXPERIMENTAL

NMR spectra were recorded in $\mathrm{CDCl}_{3}$ solution on a Bruker AV 400 spectrometer at 400 MHz for ${ }^{1} \mathrm{H}$ and 100 MHz for
${ }^{13} \mathrm{C}$, respectively. The chemical shifts were expressed in ppm ( $\delta$ scale) relative to the reference compound tetramethylsilane (TMS). Electronic impact (EI) gas chromatography-mass spectrometry (GC-MS) was conducted on an Agilent 6890 N GC coupled to an Agilent Technologies 5973 inert mass selective detector using a $30 \mathrm{~m} \times 0.25 \mathrm{~mm}$ i.d., $0.25 \mu \mathrm{~m}$ file thickness HP-5MS capillary column (Agilent Technologies, Wilmington, DE) with helium as carrier gas ( $36 \mathrm{~cm} / \mathrm{s}, 80^{\circ} \mathrm{C}$ for 2 min and then programmed to $280^{\circ} \mathrm{C}$ at $15^{\circ} \mathrm{C} / \mathrm{min}$ and held for 20 min ). A 70 eV electron beam was employed for sample ionization. GC analyses were performed on an Agilent 6890 GC equipped with a flame ionization detector (FID) using a $30 \mathrm{~m} \times 0.32$ mm i.d., $0.25 \mu \mathrm{~m}$ file thickness HP-5 capillary column with nitrogen as carrier gas $\left(38 \mathrm{~cm} / \mathrm{s}, 80^{\circ} \mathrm{C}\right.$ for 2 min and then programmed to $280^{\circ} \mathrm{C}$ at $10^{\circ} \mathrm{C} / \mathrm{min}$ and held for 20 min ) in the split mode and the split ratio was 50:1. Fourier-transform infrared (FT-IR) spectra of samples were recorded from potassium bromide disks prepared with each crystalline sample on a Nicolet 380 FT-IR spectrophotometer in the scan range of $4000-400 \mathrm{~cm}^{-1}$. Melting points and specific rotation were measured using X-6 microscopic melting point apparatus and Shanghai Spoif W22-2S automatic polarimeter. The raw material $\beta$-pinene with a purity of $98.1 \%(\mathrm{GC})$ and $[\alpha]_{\mathrm{D}}{ }^{25}-21.1^{\circ}$ ( $\mathrm{c}=1.0, \mathrm{CHCl}_{3}$ ) was purchased from Deqing Forest Chemical Plant of China. Flash column chromatography was carried out on silica gel 60 (230-400 mesh). All reactions were performed
under a nitrogen atmosphere with magnetic stirring and the syntheses of 3-arylidenenopinones from $\beta$-pinene were shown in Scheme-I.

## Synthesis

(+)-Nopinone (1): Nopinone was prepared by $\beta$-pinene oxidation using acidic potassium permanganate. A 500 mL dried three-necked flask equipped with a thermometer, condenser and stirrer was charged with acetone $100 \mathrm{~mL}, 2 \mathrm{~mol} / \mathrm{L}$ $\mathrm{H}_{2} \mathrm{SO}_{4} 15 \mathrm{~mL}$ and $\beta$-pinene 50 g and cooled with ice bath to about $15^{\circ} \mathrm{C} .87 \mathrm{~g}$ of $\mathrm{KMnO}_{4}$ fully crashed was added in portions within $1 \sim 1.5 \mathrm{~h}$. The ice bath was removed after complete addition of $\mathrm{KMnO}_{4}$ and the reaction was kept at room temperature for another 5-6 h . The reaction was monitored by GC until the peak of $\beta$-pinene was disappeared. The resulting mixture was filted with a sand-core funnel to remove the solid $\mathrm{MnO}_{2}$ and was washed with acetone $(2 \times 40 \mathrm{~mL})$. The filtrate was concentrated by a rotor evaporator to recover acetone and the bottom residue was diluted with 100 mL of hexane. The diluted residue was washed with saturated brine to neutral and the organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and then was distilled to collect the fraction at $100 \sim 102{ }^{\circ} \mathrm{C} / 266 \mathrm{kPa}$, a colourless oily liquid with a yield over $83.9 \%$, purity $95.04 \%$ (GC), specific rotation $[\alpha]_{D}^{25}+27.3^{\circ}\left(c=1.0, \mathrm{CHCl}_{3}\right)$.
(1R, 5R)-(-)-3-(4-hydroxy-3-methoxybenzylidene) nopinone (2a): A 100 mL dried flask fitted with a agitator, thermometer and condensor was charged with (+)-nopinone $(1.38 \mathrm{~g}, 0.01 \mathrm{~mol})$, vanillin $(1.824 \mathrm{~g}, 0.012 \mathrm{~mol})$ and 3 g of powderd potassium tert-butoxide in 30 mL of toluene under a nitrogen atmosphere and the resulting mixture was refluxed for $10 \sim 12 \mathrm{~h}$ until the main product reached $70 \sim 75 \%$ and the byproduct was controlled within 10~15 \% (monitored with GC) and then 15 mL of water was added. The mixture was separated into two layers and the organic layer was washed with water and brine to neutrality, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated to afford the yellow crude product, which was purified by recrystallization in mixed solvent containing 10 mL of acetone and 0.5 mL of ethanol for several days at room temperature to afford $1.044 \mathrm{~g}(3.84 \mathrm{mmol}, 38.4 \%$ isolated yield, purity $95.3 \%$ ) of compound $\mathbf{2 a}$ as a colourless transparent crystal, m.p. $173.5-174.2^{\circ} \mathrm{C},[\alpha]-44.7^{\circ}(\mathrm{c}=0.32$, $\mathrm{CHCl}_{3}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) ~ 0.929-1.379$ $\left(\mathrm{d}, 6 \mathrm{H},-\mathrm{CH}_{3}\right), 1.500-1.520\left(\mathrm{~d}, 1 \mathrm{H},-\mathrm{CH}_{2}\right), 2.368-2.379(\mathrm{~m}$, $1 \mathrm{H},-\mathrm{CH}_{2}$ ), 2.609-2.633 (m, 1H, -CH), 2.681-2.704 (t, 1 H , -CH), 2.951-2.972 (s, 2H, - $\mathrm{CH}_{2}$ ), 7.644-7.653 ( $\mathrm{s}, 1 \mathrm{H}, \mathrm{C}=\mathrm{CH}-$ C), $3.921\left(\mathrm{~s}, 3 \mathrm{H},-\mathrm{OCH}_{3}\right), 6.056(\mathrm{~s}, 1 \mathrm{H},-\mathrm{OH}), 6,955-6.972(\mathrm{~d}$, $1 \mathrm{H}, \mathrm{CH}$ ), 7.095-7.099 (s, 1H, CH), 7.189-7.209 (d, 1H, CH); ${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 21.58,26.18,27.56$,
30.95, 39.49, 55.82, 55.91, 113.61, 114.66, 124.84, 128.29, 130.16, 135.90, 203.58; FT-IR (KBr, $\left.v_{\max }, \mathrm{cm}^{-1}\right): 3238 \mathrm{v}(\mathrm{O}-\mathrm{H})$, 2966-2901 v(C-H), $1674 \mathrm{v}(\mathrm{C}=\mathrm{O}), 1593-1440\left(\mathrm{C}_{6} \mathrm{H}_{3^{-}}, \mathrm{v}_{\text {as } \mathrm{C}=\mathrm{C}}\right)$, 1307-1130 v( $\left.\mathrm{O}-\mathrm{CH}_{3}\right), 856-619 \tau(\mathrm{C}-\mathrm{H})$; EI-MS $\mathrm{m} / \mathrm{z}(\%): 272$ $\left(\mathrm{M}^{+}, 100\right), 257$ (19), 229 (18), 203 (30), 162 (26), 137 (24), 115 (21), 91 (20), 83 (16), 55 (33), 41 (19).
(1R,5R)-(-)-3-(4-hydroxybenzylidene) nopinone (2b): A 100 mL dried flask equippedd with a agitator, thermometer and condensor was charged with (+)-nopinone ( $1.380 \mathrm{~g}, 0.01$ mol), p-hydroxybenzaldehyde ( $1.83 \mathrm{~g}, 0.015 \mathrm{~mol}$ ) and 3.0 g of powderd potassium tert-butoxide in 30 mL of tert-butanol under a nitrogen atmosphere and the resulting mixture was refluxed for $7 \sim 8 \mathrm{~h}$ until the conversion ratio of nopinone reached over $95 \%$ (monitored with GC) and then 10 mL of water was added. The mixture was extracted with ethyl acetate $(3 \times 10 \mathrm{~mL})$ and the combined organic layers were washed with water and saturated brine to neutrality, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated to afford the yellow crude product, which was purified by recrystallization in 10 mL of acetone for 3 days at room temperature to provide $1.88 \mathrm{~g}(7.76 \mathrm{mmol}, 77.6 \%$ isolated yield, purity of $97.4 \%$ ) of compound $\mathbf{2 b}$ as a colourless transparent crystal, m.p. $199.6-200.6^{\circ} \mathrm{C},[\alpha]_{\mathrm{D}}{ }^{25}-56.3^{\circ}(\mathrm{c}=0.6$, $\mathrm{CHCl}_{3}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm})$ 0.929-1.378 $\left(\mathrm{d}, 6 \mathrm{H},-\mathrm{CH}_{3}\right), 1.496-1.531\left(\mathrm{~d}, 1 \mathrm{H},-\mathrm{CH}_{2}\right), 2.374-2.384(\mathrm{~m}$, $1 \mathrm{H},-\mathrm{CH}_{2}$ ), 2.587-2.641 (m, $\left.1 \mathrm{H},-\mathrm{CH}\right), 2.661-2.730(\mathrm{t}, 1 \mathrm{H}$, $-\mathrm{CH})$, 2.948-2.956 (s, $2 \mathrm{H}-\mathrm{CH}_{2}$ ), $7.690(\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}=\mathrm{CH}-\mathrm{C})$, 6.908(m, 1H, -OH), 7.312-7.601 (m, 2H, CH), 7.573-7.601 (d, 2H, CH); ${ }^{13} \mathrm{C}$ NMR ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm})$ 21.63, 26.19, 27.59, 29.69, 31.00, 39.47, 55.86, 115.78, 128.14, 129.84, 132.96, 136.23, 157.17, 204.92; FT-IR ( $\mathrm{KBr}, v_{\max }, \mathrm{cm}^{-1}$ ): $3378 \mathrm{v}(\mathrm{O}-\mathrm{H}), 2962-2911 \mathrm{v}(\mathrm{C}-\mathrm{H}), 1669 \mathrm{v}(\mathrm{C}=\mathrm{O}), 1607 \sim 1469$ $\left(\mathrm{C}_{6} \mathrm{H}_{4}-, \mathrm{v}_{\mathrm{as} \mathrm{C}=\mathrm{C}}\right)$, 987-647 ( $\left.\mathrm{C}_{6} \mathrm{H}_{4}-, \tau_{\mathrm{C}-\mathrm{H}}\right)$; EI-MS m/z (\%): 242 $\left(\mathrm{M}^{+}, 100\right), 227\left(\mathrm{M}^{+}-15,31\right), 199\left(227-\mathrm{C}_{2} \mathrm{H}_{4}, 42\right), 186$ (22), 171 (47), 132 (56), 107 (54), 83 (35), 55 (53), 41(34).
(1R, 5R)-(-)-3-(4-chlorobenzyliene) nopinone (2c): A 100 mL dried flask fitted with a agitator, thermometer and condensor was charged with (+)-nopinone ( $1.38 \mathrm{~g}, 0.01 \mathrm{~mol}$ ), p-chlorobenzaldehyde $(1.68 \mathrm{~g}, 0.012 \mathrm{~mol})$ and 3 g of powderd sodium mehoxide in 30 mL of tertiary butanol under a nitrogen atmosphere and the resulting mixture was refluxed for 5-8 h until the conversion ratio of nopinone reached $100 \%$ and 15 mL of water was added and then extracted with ethyl acetate for three times $(3 \times 15 \mathrm{~mL})$. The combined organic layer was washed with water and brine to neutrality, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated to afford the deep yellow crude product, which was purified by recrystallization in mixed solvent containing 10 mL of acetone and 0.5 mL of ethanol for several days at room temperature to afford $2.223 \mathrm{~g}(8.55 \mathrm{mmol}, 85.5 \%$ isolated yield, purity $97.8 \%$ ) of compound $\mathbf{2 c}$ as a colourless transparent crystal, m.p. $109.7-110.7^{\circ} \mathrm{C},[\alpha]_{\mathrm{D}}{ }^{25}-22.88^{\circ}$ (c $=$ $0.31, \mathrm{CCl}_{3}$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm})$ 0.921-1.381 $\left(\mathrm{d}, 6 \mathrm{H},-\mathrm{CH}_{3}\right), 1.484-1.505\left(\mathrm{~d}, 1 \mathrm{H},-\mathrm{CH}_{2}\right), 2.356-2.374(\mathrm{~m}$, $1 \mathrm{H},-\mathrm{CH}_{2}$ ), 2.618-2.651 (m, 1H, -CH), 2.694-2.717 (t, 1 H , -CH ), 2.930-2.941 (t, 2H, -CH2), 7.636-7.645 (t, 1H, C=CHC), 7.362-7.384 (t, 2H, CH), 7.499-7.516(t, 2H, CH); ${ }^{13} \mathrm{CNMR}$ ( $100 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta(\mathrm{ppm}) 21.55,26.12,27.36,30.78,39.29$, 40.82, 55.78, 128.73, 131.78, 133.10, 134.10, 134.18, 134.74, 202.91; FT-IR (KBr, $v_{\max }, \mathrm{cm}^{-1}$ ): 2984-2874 v(C-H), 1686

Crystal structure determination: Crystallographic data of 2a-2c were collected at 292 K on a Bruker SMART APEX CCD diffractometer with graphite-monochromatized $\mathrm{MoK}_{\alpha}$ radiation ( $\lambda=0.071073 \mathrm{~nm}$ ). An empirical absorption correction was applied. The structures were solved by the direct method and refined using the SHELXL-97 software ${ }^{9}$. All nonhydrogen atoms were refined by full-matrix least-squares method on $\mathrm{F}^{2}$ with anisotropy thermal parameters, while all hydrogen atoms were refined in calculated positions, assigned isotropic thermal parameters and allowed to ride their parent atoms. Crystallographic data and structure refinement results are summarized in Table-1.

## RESULTS AND DISCUSSION

The compounds $\mathbf{2 a - 2 c}$ are light yellow crystals and stable in air at room temperature. The ${ }^{1} \mathrm{H}$ NMR, MS and elemental analysis for these three compounds are all in good agreement with the assumed structure. In order to obtain a definitive structural proof of the 3-arylideneopinones and stereochemical information, the single crystal X-ray diffraction study was undertaken.

The compound 2a crystallizes in the orthorhombic space group $\mathrm{P} 2_{1} 2_{1} 2_{1}$. The molecular structure of the compound $\mathbf{2 a}$ is shown in Fig. 1, which displays the $\mathbf{E}$ conformataion with respect to the $\mathrm{C}=\mathrm{C}$ double bond mainly due to the intramolecular repulsive interaction between O 3 and H6A. The absolute

Fig. 1. Molecular structure of the compound 2a
configuration of C11 and C13 was established as R. The selected bond lengths and bond angles are listed in Table-2. The $\mathrm{C}-\mathrm{C}$ bond lengths within the phenyl ring are normal in the range from $0.1380(2)$ to $0.1409(2) \mathrm{nm}$ with normal angles close to $120^{\circ}$ with the exception of the the angle (C2-C1-C6, 117.61(13). The cyclohexanone ring in the bicyclic ring system adopts a flattened half chair conformation that is constrained by the dimethyl substituted cyclobutane ring. The dihedral angle between the plane consisting of C9-C10-C11-C13-C14 and the phenyl ring is 5.04 $(0.10)^{\circ}$, which indicates the two planes are nearly coplanar. In addition, the aromatic ring bonded to the C 8 is coplanar around the C8-C9 bond with a torsion angle C6-C1-C8-C9 of 2.6 (3) ${ }^{\circ}$, which suggests a conjugation with the remaining part of the system of C8-C9-C10-O2. The bond length of C8-C9 and C10O3 are $0.1348(2)$ and $0.12248(17) \mathrm{nm}$ respectively which indicates a doule-bond character, but they are slight longer than that of lack conjugation of the double bond ${ }^{10}$. However, the C1-C8 (0.1463(2) is shorter than the normal C-C single bond, suggesting a big conjugation system exists in the double bond and phenyl ring and the electronic transfer occurs from the aromatic ring the

is $-31.92(1)^{\circ}$. All these parameters indicate that there is lack of conjugation in the system of C7-C8-C9-O2. However, there is also a strong intermolecular O-H $\cdots$ O hydrogen bond (Table-5) between the carbonyl and hydroxy groups which link the molecules into a two-dimesional network, in which they may be effective in the stabilization of the structure.

## TABLE-5

HYDROGEN BOND LENGTHS (Å) AND BOND ANGLES ( ${ }^{\circ}$ ) FOR THE COMPOUND 2b

| $\mathrm{D}-\mathrm{H} \cdots \mathrm{A}$ | $\mathrm{d}(\mathrm{D}-\mathrm{H})$ | $\mathrm{D}(\mathrm{H} \cdots \mathrm{A})$ | $\mathrm{D}(\mathrm{D} \cdots \mathrm{A})$ | $\angle \mathrm{DHA}$ |

| $\mathrm{O} 1-\mathrm{H} 1 \mathrm{~A} \cdots \mathrm{O} 2^{\mathrm{i}}$ | $0.88(5)$ | $1.91(5)$ | $2.775(2)$ | $169(4)$ |
| Symmetry code: $(\mathrm{i})-\mathrm{x}+\mathrm{y}+1 / 2,-\mathrm{x}+1, \mathrm{z}-2 / 3$ |  |  |  |  |

The compound 2c crystallizes in the orthorhombic space group $\mathrm{P} 2_{1}$. The molecular structure of the compound $\mathbf{2 c}$ is shown in Fig. 4. There are four crystallographically independent molecules in the asymmetric unit different from 2a and 2b. The selected bond lengths and bond angles are listed in Table-6. The C-Cl bond distances are in the range of 1.736(3)1.743(3) A. There are lack of inetermolecular hydrogen and $\pi-\pi$ stacking interactions, the molecular strucuture is is stablilized by van der Waals forces.

Fig. 4. Molecular structure of the compound 2c (hydrogen atoms were omitted for clarity)

## Conclusion

Three (1R, 5R)-(-)3-arylideneopinone derivatives (2a, 2b and 2c) were successfully synthesized and characterized by single-crystal X-ray diffraction method. These compounds crystallize on three different space group belongs $\mathrm{P} 2_{1} 2_{2} 2_{1}, \mathrm{P} 32$ and P21 respectively. There is also a strong intermolecular $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bond between the carbonyl and hydroxy groups in 2a and 2b, but there are lack of inetermolecular hydrogen in $2 \mathbf{c}$.

## ACKNOWLEDGEMENTS

The authors acknowledged the financial support received from Forestry Public Sector Research Fund of State Forestry Administration of China (Grant No. 201104015) and from the Committee of National Natural Science Foundation of China (Grant No. 30972316 and No. 31170538), and a project funded by the Priority Academic Program Development of Jiangsu Higher Education institutions. Thanks are also due to Mr. Lai Jie who provided the starting material.
